## Some Basic Information

## When Newton's laws are applied, external forces are only of interest!!

Why?
Because, as described in Newton's first law, an object will keep its current motion unless non-zero net external force is applied.

Normal Force, n:

Tension, $\mathbf{T}$ :

Free-body diagram

Reaction force that reacts to gravitational force due to the surface structure of an object. Its direction is perpendicular to the surface.

The reactionary force by a stringy object against an external force exerted on it.

A graphical tool which is a diagram of external forces on an object and is extremely useful analyzing forces and motion!! Drawn only on an object.

## Free Body Diagrams

> Diagrams of vector forces acting on an object

- A great tool to solve a problem using forces or using dynamics
- Select a point on an object and w/ information given
> Identify all the forces acting only on the selected object
> Define a reference frame with positive and negative axes specified

D Draw arrows to represent the force vectors on the selected point
> Write down net force vector equation
> Write down the forces in components to solve the problems
> No matter which one we choose to draw the diagram on, the results should be the same, as long as they are from the same motion

## SOME APPLICATIONS OF NEWTON'S LAWS

## Example 5.4

A traffic light weighing 125 N hangs from a cable tied to two other cables fastened to a support as shown in the figure. Find the tension in the three cables.

x-comp. of net force

$$
\sum F_{x}=0 \Rightarrow-T_{1} \cos \left(37^{\circ}\right)+T_{2} \cos \left(53^{\circ}\right)=0 \quad \therefore T_{1}=\frac{\cos \left(53^{\circ}\right)}{\cos \left(37^{\circ}\right)} T_{2}=0.754 T_{2}
$$

$y$-comp. of net force

$$
\begin{aligned}
\sum F_{y}=0 \Rightarrow & T_{1} \sin \left(37^{\circ}\right)+T_{2} \sin \left(53^{\circ}\right)-m g=0 \\
& T_{2}\left[\sin \left(53^{\circ}\right)+0.754 \times \sin \left(37^{\circ}\right)\right]=1.25 T_{2}=125 \mathrm{~N} \\
& T_{2}=100 \mathrm{~N} ; \quad T_{1}=0.754 T_{2}=75.4 \mathrm{~N}
\end{aligned}
$$

- Start with $\boldsymbol{F}=m \boldsymbol{a}$.

Plug in $F=50 \mathrm{~N}, d=10 \mathrm{~m}, m=100 \mathrm{~kg}$ :

## - Draw a Free Body Diagram

Use Newton's 2nd law in the upward direction:
$\Sigma F=m a$
$\boldsymbol{T}-\boldsymbol{m g}=\boldsymbol{m a}$
$T=m a+m g=m(g+a)$

## EXAMPLE APPERENT WEIGHT

In the Figure shown, a passenger of mass $m=72.2 \mathrm{~kg}$ stands on a platform scale in an elevator cab. We are concerned with the scale readings when the cab is stationary, and when it is moving up or down. (a) Find a general solution for the scale reading, whatever the vertical motion of the cab.

## SOLUTION:

$$
\begin{aligned}
& N-m g=m a \\
& N=m(g+a)
\end{aligned}
$$

(b) What does the scale read if the cab is stationary or moving upward at a constant $0.50 \mathrm{~m} / \mathrm{s}$ ?

$$
N=(72.2 \mathrm{~kg})\left(9.8 \mathrm{~m} / \mathrm{s}^{2}+0\right)=708 \mathrm{~N}
$$

(c) What does the scale read if the cab accelerates upward at $3.20 \mathrm{~m} / \mathrm{s}^{2}$ and downward at $3.20 \mathrm{~m} / \mathrm{s}^{2}$ ?

$$
\begin{aligned}
& N=(72.2 \mathrm{~kg})\left(9.8 \mathrm{~m} / \mathrm{s}^{2}+3.20 \mathrm{~m} / \mathrm{s}^{2}\right)=939 \mathrm{~N} \\
& N=(72.2 \mathrm{~kg})\left(9.8 \mathrm{~m} / \mathrm{s}^{2}-3.20 \mathrm{~m} / \mathrm{s}^{2}\right)=477 \mathrm{~N}
\end{aligned}
$$

(d) During the upward acceleration in part (c), what is the magnitude $F_{\text {net }}$ of the net force on the passenger, and what is the magnitude $a_{p, c a b}$ of the passenger's acceleration as measured in the frame of the cab?

$$
\begin{aligned}
& \vec{F}_{\text {net }}=m \vec{a}_{p, c a b} ? \\
& \\
& \\
& \quad F_{\text {net }}=N-F_{g}=939 \mathrm{~N}-708 \mathrm{~N}=231 \mathrm{~N}
\end{aligned}
$$

The acceleration $a_{p, c a b}$ of the passenger relative to the frame of the cab is zero. Thus, in the noninertial frame of the accelerating cab, $F_{\text {net }}$ is not equal to $\mathrm{ma}_{\mathrm{p}, \mathrm{cab}}$, and Newton's second law does not hold

## ELEVATOR

## APPERENT WEIGHT

Consider $x$ and $y$ components separately:

- x: $m g \sin \theta=m a . \quad a=g \sin \theta$
y: $N-m g \cos \theta=0 . \quad N=m g \cos \theta$

## Atwood's Machine:

Masses $m_{1}$ and $m_{2}$ are attached to an ideal massless string and hung as shown around an ideal massless pulley.
Find the accelerations, of the masses.
What is the tension in the string $T$ ?

Assume $m_{1}>m_{2}$ : the direction of Motion is shown

- Draw free body diagrams for each object
- Define the acceleration direction
- Applying Newton's Second Law:

Form
$m_{1} g-T_{1}=m_{1} a$
For $m_{2}$
$T_{2}-m_{2} g=m_{2} a$
$\square$ But $T_{1}=T_{2}=T$
since pulley is ideal

$$
\begin{align*}
& m_{1} g-T=m_{1} a \\
& T-m_{2} g=m_{2} a \tag{b}
\end{align*}
$$

- Two equations \& two unknowns

- we can solve for both unknowns ( $T$ and $a$ ).
- add $(b)+(a):$
$\left(m_{1}-m_{2}\right) g=\left(m_{1}+m_{2}\right) a$

$$
a=\frac{\left(m_{1}-m_{2}\right)}{\left(m_{1}+m_{2}\right)} g
$$

- Substitute the value of a in eq. (b), we obtained;

$$
T=2 m_{1} m_{2} /\left(m_{1}+m_{2}\right) g
$$

Is the result reasonable? Check limiting cases!
Special cases:
i.) $m_{l}=m 2=m \quad \Rightarrow \quad a=0$ and $T=m g$. OK!
ii.) $m_{2}$ or $m_{l}=0 \quad \Rightarrow \quad|a|=g$ and $T=0$. OK!

- Atwood's machine can be used to determine g (by measuring the acceleration a for given masses).

## Example;

A 5 kg block is placed on a frictionless inclined plane of angle $30^{\circ}$ and pushed up the plane with a horizontal force of magnitude 30 N .

## Draw a free body diagram for the mass:

What are all of the forces acting?

- Using components
$x: \boldsymbol{F}_{\boldsymbol{X}}=\boldsymbol{T}_{\boldsymbol{X}}=\boldsymbol{T} \sin \theta=m a$
$y: F_{Y}=T_{Y}-m g$

Accelerometer

- Let's put in some numbers:
- Say the car goes from 0 to $\mathbf{6 0} \mathbf{~ m p h}$ in $\mathbf{1 0}$ seconds:
$-60 \mathrm{mph}=60 \times 0.45 \mathrm{~m} / \mathrm{s}=27 \mathrm{~m} / \mathrm{s}$.
- Acceleration $a=\Delta v / \Delta t=2.7 \mathrm{~m} / \mathrm{s}^{2}$.
- So $\quad a / g=2.7 / 9.8=0.28$.
