Question $1[4,4]$ a) Discuss the existence of unique solution of the following initial value problem

$$
\left\{\begin{array}{c}
(x-2) y^{\prime \prime}+\frac{x}{\sqrt{3-x}} y^{\prime}+\frac{1}{x^{2}-4} y=\cos x \\
y(1)=0, y^{\prime}(1)=1 .
\end{array}\right.
$$

b) Solve the nonhomogeneous differential equation

$$
y^{\prime \prime}-2 y^{\prime}-3 y=e^{2 x}+5 \cos 2 x
$$

Question $2[4,3]$. a) If $y_{1}=x^{3} e^{x}$ is a solution of the differential equation

$$
x y^{\prime \prime}-2(x+1) y^{\prime}+(x+2) y=0, \quad x \neq 0
$$

then use reduction of order method to obtain its general solution.
b) Determine either the functions

$$
f_{1}(x)=e^{2 x}, \quad f_{2}(x)=e^{-2 x}, \quad f_{3}(x)=\cosh 2 x
$$

are linearly independent or linearly dependent on $(-\infty, \infty)$.
Question 3 [5] Find the general solution of the differential equation

$$
x^{2} y^{\prime \prime}-3 x y^{\prime}+3 y=x^{4} e^{x} ; \quad x>0
$$

Question 4 [5] Solve the following linear system of differential equations.

$$
\left\{\begin{array}{c}
x^{\prime}=x-y+t \\
y^{\prime}=x+3 y-3 t
\end{array}\right.
$$
