BACTERIAL APPENDAGES

STRUCTURE

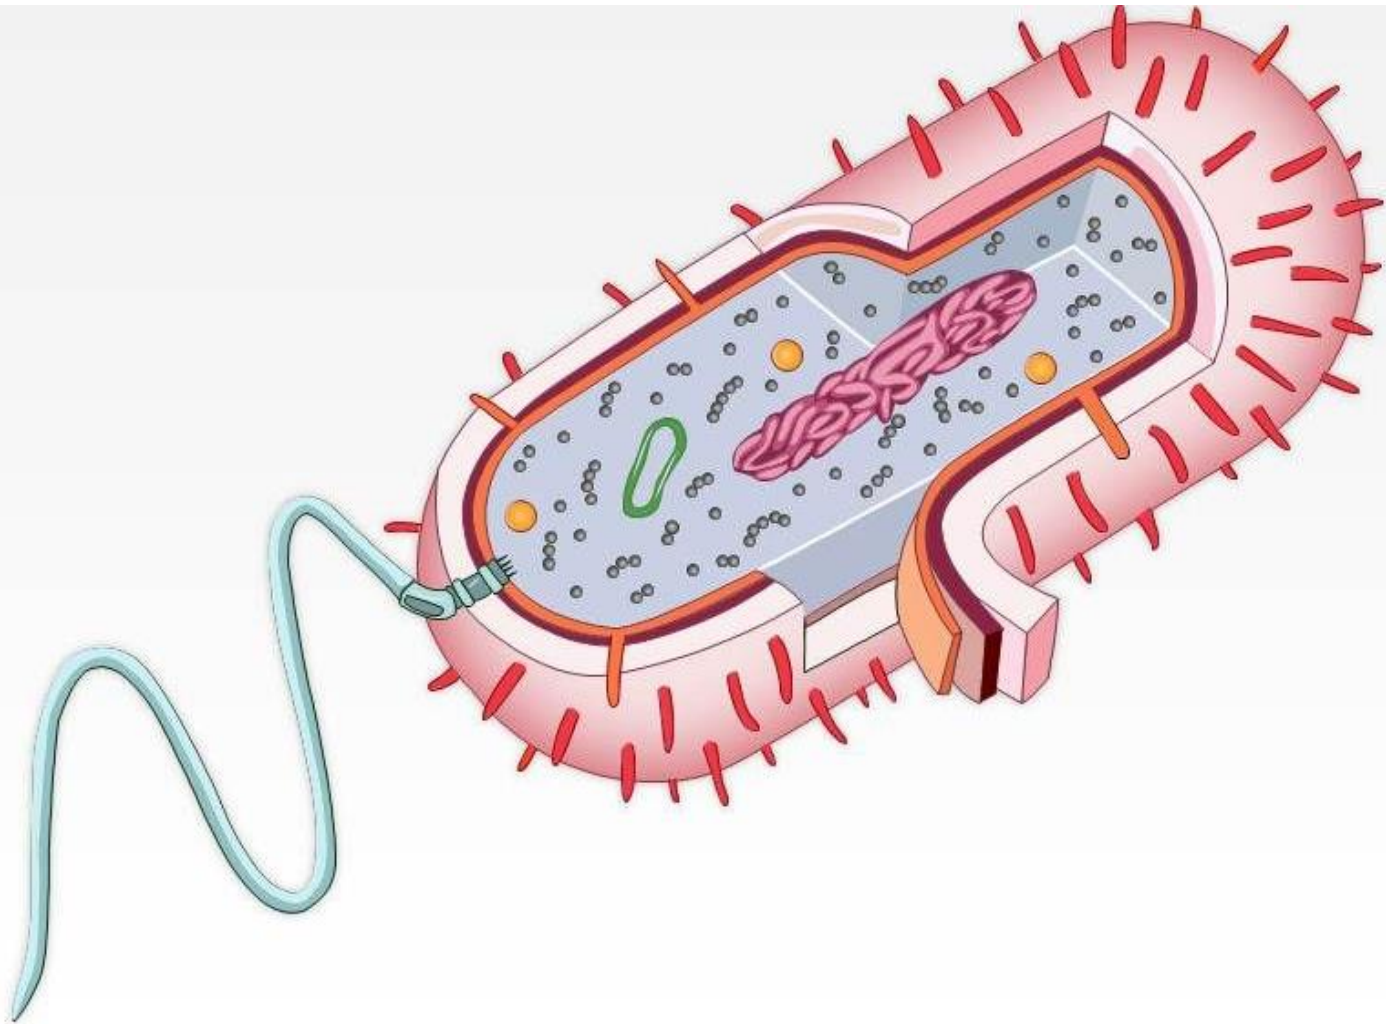

Capsule.

- ◆- Flagella
- ◆- Pili
- ◆- Fimbriae

Endospores

CAPSULE

1. BACTERIAL SURFACE STRUCTURE

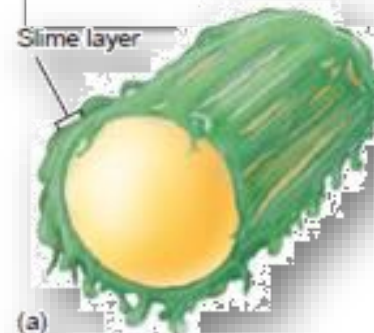

CELL ENVELOPE

⊙ **Glycocalyx** some extracellular material secreted by many bacterial cells in the form of

Capsule - attached tightly to the bacterium and has definite boundaries.

⊙ **Slime layer - loosely associated with the bacterium and can be easily washed off.**

COMPOSITIONS

Proteins
sometimes

⊙ **Layer of polysaccharide**

FUNCTIONS OF THE CAPSULE

1. Protection from phagocytic engulfment.

2. Identification.

3. Vaccine preparation.

4. Tissue attachment.

5. Depot for waste products.

6. Resistance to drying.

MEDICAL IMPORTANCE

RAPID SEROLOGICAL IDENTIFICATION OF

⊙ Several groups of streptococci

⊙ Meningococcus

⊙ *Hemophilus influenzae*

⊙ *Klebsiella pneumoniae*

⊙ Some of the coliforms

Yersinia and Bacillus specie

CAPSULE STAIN

WHY WE USE CAPSULE STAIN?

- ⊙ Bacterial capsules are **non-ionic**, so neither acidic or basic stains will adhere to their surfaces.
- ⊙ Because most capsule materials are water soluble, simple stains will not adhere to them.

NOTE:

- ⊙ Older cultures are more likely to exhibit capsule production.
- ⊙ Make sure the culture you take your sample from is at least five days old.

MATERIALS

1- Clean slide microscope.

2- India Ink (nigrosin) , crystal violet and Copper sulfate (CuSO_4).

3- Bibulous paper.

4- Culture of bacteria.

5- Sterile loop.

MIX BACTERIA & STAIN
CAPSULE STAINS ARE NOT
HEAT- FIXED

SPREAD MIXTURE

MATERIALS

PICTURES OF CAPSULE STAIN

Neisseria meningitidis - Gram-negative coccus, non-motile bacteria occur as two cells (orange) in a capsule (yellow)

Haemophilus influenzae bacteria in the process of expressing polysaccharide capsules.
