## Preparation of Different Buffer Solutions

$\square$ All biochemical reactions occur under strict conditions of the concentration of hydrogen ion.
$\square$ Biological life cannot withstand large changes in hydrogen ion concentrations which we measure as the pH .
$\square$ Those solutions that have the ability to resist changes in pH upon the addition of limited amounts of acid or base are called $\mathbb{B U} \mathbb{F} \| F \mathbb{R} S$ 。

## Two types of Buffers

A buffer is made up of a weak acid and its conjugate base.
Or
A weak base and its conjugate acid.

## Acidic Buffer

Are made from weak acid and its conjugated
base[ its salt].

## Example:

1. $\mathrm{CH}_{3} \mathrm{COOH} / \mathrm{CH}_{3} \mathrm{COONa}$ (Pka)
$\rightarrow \mathrm{CH} 3 \mathrm{COOH}$ (Weak acid)
$\rightarrow \mathrm{CH} 3 \mathrm{COONa}$ (conjugated base -its salt-)
2. $\mathrm{NaH}_{2} \mathrm{PO}_{4} / \mathrm{Na}_{2} \mathrm{HPO}_{4}$ (Pka)

## Basic Buffer

Are made from weak base and its conjugated acid [ its salt].

## Example:

1. $\mathrm{NH}_{3} / \mathrm{NH}_{4} \mathrm{Cl}(\mathrm{Pkb})$
$\rightarrow \mathrm{NH}_{3}$ (Weak base)
$\rightarrow \mathrm{NH}_{4} \mathrm{Cl}$ (conjugated acid -its salt-)

## Mechanism of Action:

- How buffers can resist the change in pH ?
-Example using [HA/A-] buffer:
$\rightarrow$ Where: HA is Weak acid and A- is conjugated base [its salt].

## $\mathrm{HA} \rightleftharpoons \mathrm{H}^{+}+\mathrm{A}^{-}$

If $\mathbf{H}^{+}$(acid) is added to this buffer system $\rightarrow \mathbf{H}^{+}$will react with conjugated base $\rightarrow$ to give conjugate acid.

If $\mathbf{O H}^{-}$(base) is added to this buffer system $\rightarrow \mathbf{O H}^{-}$will react with conjugated acid $\rightarrow$ to give conjugate base and $\mathrm{H}_{2} \mathrm{O}$.
$\mathrm{HA} \stackrel{\text { он }}{\rightleftharpoons} \mathrm{A}^{-}+\mathrm{H}_{2} \mathrm{O}$

## Mechanism of Action

## Mechanism of Action cont':

## - Example:

- Buffer system: $\mathrm{CH}_{3} \mathrm{COOH} / \mathrm{CH}_{3} \mathrm{COO}^{-}$
- When acid $\left[\mathrm{H}^{+}\right]$added:

$$
\mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{H}^{+} \quad \mathrm{CH}_{3} \mathrm{COOH}
$$

- When base $\left[\mathrm{OH}^{-}\right]$added:

$$
\mathrm{CH}_{3} \mathrm{COOH}+\mathrm{OH}^{-} \longrightarrow \mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{H}_{2} \mathrm{O}
$$

NOTE: It resists pH changes when it's two components are present in specific proportions.
$\rightarrow$ Thus the buffer is effective as long as it does not run out of one of its components. (There are enough conjugated base and conjugated acid to absorb the $\mathrm{H}^{+}$ions or $\mathrm{OH}^{-}$ions added to the system respectively).

## Henderson-Hasselbalch equation:

$\square$ It is often used to perform:

1. To calculate the pH of the Buffer.
2. To preparation of Buffer.

$$
p H=p K_{a}+\log \frac{\left[A^{-}\right]}{[H A]}
$$

- It relates the Ka [dissociation constant] of a weak acid , [HA] concentration of weak acid component, [A-] concentration of conjugate base [salt of the weak acid] component and the pH of the buffer.
$\square$ The equation is derived from the acid dissociation constant.

## Henderson-Hasselbalch equation cont':

- A buffer is best used close taits piKa [to act as a good buffer the pH of the solution must be within one pH unit of the pKa ].
$\rightarrow$ The buffer capacity is optimal when the ratio of the weak acid to its salt is $1: 1$; that is, when $\mathrm{pH}=\mathrm{pKa}$

$$
\begin{gathered}
\mathrm{pH}=\mathrm{pka}+\log \mathrm{l} \\
\mathrm{pH}=\mathrm{pka}+\mathrm{o} \\
\mathrm{pH}=\mathrm{pka}
\end{gathered}
$$

## Calculating the pH :

For weak acid [not buffers]

$$
\mathrm{pH}=\frac{\mathrm{pka}+\mathrm{p}[\mathrm{HA}]}{2}
$$

* $\mathrm{P}[\mathrm{HA}]=-\log [\mathrm{HA}]$

[Pkw : number of dissociation constant of $\mathrm{H}_{2} \mathrm{O}$ ].

For buffers

$$
p H=p K_{a}+\log \frac{\left[A^{-}\right]}{[H A]}
$$

## Prachical Par\}

## Objectives:

$\square$ To understand the behaviour and nature of buffers solutions.
$\square$ To learn how to prepare buffers.

## A) Nature of buffers:

## Method:

1. You are provided with: 0.2 M solution of $\mathrm{CH}_{3} \mathrm{COOH}, 0.2 \mathrm{M}$ solution of $\mathrm{CH}_{3} \mathrm{COONa}$.
$\Rightarrow$ Determine which is the weak acid and which is the conjugated base [or its salt].
2. Calculate the volume that you must take from $\mathrm{CH}_{3} \mathrm{COOH}$ and $\mathrm{CH}_{3} \mathrm{COONa}$ to prepare the following mixtures with final volume of the solution $=\mathbf{2 0} \mathbf{~ m l}$ :
3. $100 \%$ [HA]
4. $75 \%$ [HA], $25 \%\left[\mathrm{~A}^{-}\right]$
5. $50 \%[\mathrm{HA}], 50 \%\left[\mathrm{~A}^{-}\right]$
6. $25 \%[\mathrm{HA}], 75 \%\left[\mathrm{~A}^{-}\right]$
7. Calculate the pH for each solution [ pKa of $\mathrm{CH}_{3} \mathrm{COOH}=4.76$ ].
8. Follow the table.

## Calculations:

1. To Calculate the volume that you must take from CH 3 COOH and CH 3 COONa to prepare the previous mixtures with final volume of the solution $\mathbf{= 2 0} \mathbf{~ m l}$ :
(A) $100 \%$ [HA]:

The final volume is 20 ml , So:
$20 \times 100 \%=(20 \times 100) / 100=20 \mathrm{ml}$
$\rightarrow$ Take 20 ml of HA and measure the pH .
(B) $\mathbf{7 5 \%}$ [HA], 25\% [A- $]:$

From HA $=20 \times 75 \%=(75 \times 20) / 100=15 \mathrm{ml}$
From A- $=20 \times 25 \%=(25 \times 20) / 100=5 \mathrm{ml}$
$\rightarrow$ Mix 15 ml HA and $5 \mathrm{ml} \mathrm{A}^{-}$and measure the pH (measured PH ) note that the total volume is 20 ml $[15 \mathrm{ml}+5 \mathrm{ml}=20 \mathrm{ml}]$
$\square$ The same way for other mixtures ...

## Calculations cont':

2. To Calculate the $\mathbf{p H}$ for the previous mixtures with pKa of $\mathrm{CH}_{3} \mathrm{COOH}=4.76$ :
(A) $\mathbf{1 0 0 \%}$ [HA]:

$$
\mathrm{pH}=\frac{(\mathrm{pKa}+\mathrm{p}[\mathrm{HA}])}{2} \rightarrow \mathrm{p}[\mathrm{HA}]=-\log 0.2=0.69 \rightarrow \mathrm{pH}=\frac{(4.76+0.69)}{2}=\underline{\mathbf{2 . 7 2}}
$$

(B) $\mathbf{7 5 \%}$ [HA], 25\% [A-]:

$$
\begin{aligned}
\mathrm{pH}=\mathrm{pka}+\log \left[\mathrm{A}^{-}\right] /[\mathrm{HA}] \rightarrow \mathrm{pH}=4.76+\log \left[\mathrm{A}^{-}\right] /[\mathrm{HA}] \rightarrow[\mathrm{HA}] & =\mathrm{C}_{1} \times \mathrm{VV}_{1}=\mathrm{C}_{2} \times \mathrm{V}_{2} \\
& =0.2 \times 15=\mathrm{C}_{2} \times 20=\mathrm{C} 2=0.15 \mathrm{M} \\
\rightarrow\left[\mathrm{~A}^{-}\right] & =\mathrm{C}_{1} \times \mathrm{V}_{1}=\mathrm{C}_{2} \times \mathrm{V}_{2} \\
& =0.2 \times 5=\mathrm{C}_{2} \times 20=\mathrm{C} 2=0.05 \mathrm{M}
\end{aligned}
$$

So, $\mathrm{pH}=4.76+\log 0.05 / 0.15 \rightarrow \mathrm{pH}=\underline{4.282}$

## Calculations cont':

(C) $\mathbf{5 0 \%}[\mathrm{HA}], \mathbf{5 0 \%}[\mathrm{A}]$ :

$$
\begin{aligned}
\mathrm{pH}=\mathrm{Pka}+\log \left[\mathrm{A}^{-}\right] /[\mathrm{HA}] \rightarrow \mathrm{pH}=4.76+\log \left[\mathrm{A}^{-}\right] /[\mathrm{HA}] \quad \rightarrow[\mathrm{HA}] & =\mathrm{C}_{1} \times \mathrm{XV}_{1}=\mathrm{C}_{2} \mathrm{X} \mathrm{~V}_{2} \\
& =0.2 \times 10=\mathrm{C} 2 \times 20=\mathrm{C} 2=0.1 \mathrm{M} \\
\rightarrow[\mathrm{~A}-] & =\mathrm{C}_{1} \mathrm{XV}_{1}=\mathrm{C}_{2} \times \mathrm{V}_{2} \\
& =0.2 \times 10=\mathrm{C}_{2} \times 20=\mathrm{C} 2=0.1 \mathrm{M}
\end{aligned}
$$

So, $\mathrm{pH}=4.76+\log 0.1 / 0.1 \rightarrow \mathrm{pH}=4.76+0=\underline{4.76}[\mathbf{p H}=\mathbf{p k a}]$
(D) $\underline{\mathbf{2 5} \%}$ [НА], $\mathbf{7 5 \%}$ [A-]:

$$
\begin{aligned}
\mathrm{pH}=\mathrm{pka}+\log [\mathrm{A}-] /[\mathrm{HA}] \rightarrow \mathrm{pH}=4.76+\log [\mathrm{A}-] /[\mathrm{HA}] \rightarrow[\mathrm{HA}] & =\mathrm{C}_{1} \mathrm{XV}_{1}=\mathrm{C}_{2} \mathrm{XV}_{2} \\
& =0.2 \times 5=\mathrm{C}_{2} \times 20=\mathrm{C} 2=0.05 \mathrm{M} \\
& \rightarrow\left[\mathbf{A}^{-}\right]=\mathrm{C}_{1} \mathrm{XV}_{1}=\mathrm{C}_{2} \mathrm{XV}_{2} \\
& =0.2 \times 15=\mathrm{C}_{2} \times 20=\mathrm{C} 2=0.15 \mathrm{M}
\end{aligned}
$$

So, $\mathrm{pH}=4.76+\log 0.15 / 0.05 \rightarrow \mathrm{pH}=\underline{5.24}$

## Method:

| Solutions | $\begin{gathered} \mathrm{HA} \\ \mathrm{CH}_{3} \mathrm{COOH} \\ (\mathrm{ml}) \end{gathered}$ | $\begin{gathered} \mathrm{A}^{-} \\ \mathrm{CH}_{3} \mathrm{COONa} \\ (\mathrm{ml}) \end{gathered}$ | Final volume (ml) | Calculated $\mathrm{pH}$ | Measured pH | $\begin{aligned} & \text { 2M HCl } \\ & (\mathrm{ml}) \end{aligned}$ | Measured pH | The difference |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 100\%[HA] | 20 ml | 0 | 20 ml | 2.729 |  | 0.1 |  |  |
| 75\%[HA],25\% [A-] | 15 ml | 5 ml | 20 ml | 4.28 |  | 0.1 |  |  |
| 50\% [HA],50\% ${ }^{\text {[ }}{ }^{-}$] | 10 ml | 10 ml | 20 ml | 4.76 |  | 0.1 |  |  |
| 25\%[HA],75\%[ ${ }^{-}$] | 5 ml | 15 ml | 20 ml | 5.24 |  | 0.1 |  |  |

## B) Preparation of buffer:

$\square$ You are provided with $\mathbf{0 . 2 \mathrm { M }}$ acetic acid and solid sodium acetate.
Prepare 50 ml of a 0.19 M acetate buffer $\mathrm{pH}=4.86$ if you know that ( $\mathrm{pKa}=4.7$ ).

## Calculations:

- Solid sodium acetate [as A-].
- 0.2M Acetic acid [as HA].
- $\mathrm{Pka}=4.76$

- Final volume of buffer $=50 \mathrm{ml}$
- $\mathrm{pH}=4.86$
- Buffer concentration $=0.19 \mathrm{M}$
- Buffer Concentration $=[\mathrm{HA}]+\left[\mathrm{A}^{-}\right]$
$0.19=[\mathrm{HA}]+\left[\mathrm{A}^{-}\right]$

## Calculations cont' (first method):

$\square$ To prepare a buffer Henderson-Hasselbalch equation is used:

$$
\mathbf{p H}=\mathbf{p k a}+\log [\mathbf{A}-] /[\mathbf{H A}]
$$

$\square \quad$ First calculate the concentration of the weak acid and its conjugated base that make up the buffer with 0.19 M :
$\rightarrow$ Assume $\left[\mathrm{A}^{-}\right]=\mathrm{y} \quad$ and $\quad[\mathrm{HA}]=0.19-\mathrm{y}$
So:
$4.86=4.76+\log \frac{\mathrm{y}}{0.19-\mathrm{y}}$
$0.1=\log \frac{\mathrm{y}}{0.19-\mathrm{y}} \quad \boldsymbol{\rightarrow}$ by taking the "Anti $\log$ for both sides" $\boldsymbol{\rightarrow} \quad 1.26=\frac{\mathrm{y}}{0.19-\mathrm{y}}$
$\mathrm{y}=1.26 \mathrm{x}(0.19-\mathrm{y}) \quad \rightarrow \quad \mathrm{y}=0.24-1.26 \mathrm{y} \quad \rightarrow \quad \mathrm{y}+1.26 \mathrm{y}=0.24 \quad \rightarrow \quad 2.26 \mathrm{y}=0.24$
$\mathrm{y}=0.11 \mathrm{M}$ [which is the concentration of [A-] in the buffer ]

So,

$$
0.11+0.08=0.19 \mathrm{M}
$$

$[\mathrm{HA}]=0.19-0.11$
$=\underline{0.08 \mathrm{M}}$ [which is the concentration of $[\mathrm{HA}]$ in the buffer ]

## Calculations cont' (second method):

$\square$ To prepare a buffer Henderson-Hasselbalch equation is used:

$$
\mathbf{p H}=\mathbf{p k a}+\log [\mathbf{A}-] /[\mathbf{H A}]
$$

$\square$ First calculate the concentration of the weak acid and its conjugated base that make up the buffer with 0.19 M :
First: $4.86=4.76+\log \frac{[\mathrm{A}-]}{[\mathrm{HA}]}$

$$
\begin{aligned}
& 0.1=\log \frac{[\mathrm{A}-]}{[\mathrm{HA}]} \quad \rightarrow \text { by taking the "Anti } \log \text { for both sides" } \rightarrow \frac{[\mathrm{A}-]}{[\mathrm{HA}]}=1.26=\frac{1.26}{1} \\
& \mathrm{SO}: \frac{1.26}{2.26} \text { of total }=[\mathrm{A}-] \quad \text { and } \quad \frac{1}{2.26} \text { of total }=[\mathrm{HA}]
\end{aligned}
$$

[A-] $=\frac{1.26}{2.26} \times 0.19=0.11 \mathbf{M}$ [which is the concentration of $\left[A^{-}\right]$in the buffer ]
$[H A-]=\frac{1}{2.26} \times 0.19=\underline{0.08} \mathbf{M}$ [which is the concentration of [HA] in the buffer ]

$\qquad$

## Calculations cont':

- To calculate the volume needed from [HA] to prepare the buffer, No. of mole of [HA] should be calculated first:

No. of mole $\begin{aligned} & =\text { Molarity } \mathbf{x} \text { Volume of solution in } L \\ & =0.08 \mathrm{X} 0.05=0.004 \mathrm{~mole}\end{aligned}$

$$
=0.08 \times 0.05=0.004 \mathrm{~mole}
$$

So, $\mathbf{M}$ of stock $=$ no. of mole $/$ Volume in Liter

$$
0.2=0.004 / \mathrm{V}
$$

$\rightarrow \mathrm{V}=0.02 \mathrm{~L}=\underline{20 \mathrm{ml}}$
$\square$ To calculate the weight needed from [A-] to prepare the buffer, No. of mole of [A-] should be calculated first:

No. of mole $=$ Molarity $x$ volume of solution in $L$

$$
=0.11 \times 0.05=0.0055 \mathrm{~mole}
$$

weight in (g) of [A-] = No. of moles $x$ MW

$$
\begin{aligned}
& \text { Problem 1-27, p39 } \\
& \text { Problem 1-28, p40 }
\end{aligned}
$$

$\rightarrow \quad=0.0055 \times 82=\underline{0.451 \mathrm{~g}}$

## Method:

$\square$ Now take 20 ml from 0.2 M acetic acid and 0.451 g from solid sodium acetate and then complete the volume up to 50 ml by addition of water.

## C) Testing for buffering behaviour:

$\square$ In one beaker add 10 ml of 0.19 M acetate buffer that you have prepared, and in another beaker add 10 ml of 0.2 M KCl .
$\square$ Measure the pH .
$\square$ Add 0.1 ml from 2 M HCl to for both solutions.
$\square$ Measure the pH after the addition.

| Solution | Measured $\mathbf{p H}$ | Add 2M HCl | Measured pH |
| :---: | :---: | :---: | :---: |
| 0.19 M acetate buffer |  | 0.1 ml |  |
| 0.2 M KCl |  | 0.1 ml |  |
|  |  |  |  |
