

PHP (Week #9)

Exercise 1

Provide the necessary PHP and HTML code that produces a web page which contains a function that returns automatically increment the value of x.

```
static $x=45;
```

This website should print only the result:

45
46
47
48
49

Hint:

`myFunction();`

You will need 5 calls to myFunction where each call will add one to variable x and print it.

Exercise 2

Provide the necessary PHP and HTML code that produces a web page with a form which asks the user to enter his name and age. Once the user clicks on submit, the it would take him/her to “welcome.php”. Instead of using POST method, you are asked to use GET method instead this time.

Name: Age:

This website should print only the result:

Welcome SWE381.
You are 20years old!

Please pay attention how is the data being sent:

 localhost/SWE_381/welcome.php?fname=SWE381&age=20
