**Ex.1** Consider the following cash flow profile and assume MARR is 10% per year compounded annually.

EOY	0	1	2	3	4	5	6
NCF	-\$70,000	\$30,000	\$30,000	\$30,000	\$30,000	\$30,000	\$32,000

- Determine the IRR for this project.
- Is this project economically attractive?

**Solution** *By Compound interest formulas*

$$P_w(\text{IRR}) = -70,000 + 30,000 \frac{(1+i)^5 - 1}{i(1+i)^5} + 32,000(1+i)^{-6} = 0 \Rightarrow \text{IRR} = 36.35\%$$

Since  $\text{IRR} > \text{MARR}$ , the project is economically attractive.

## Solution *By Compound interest tables*

$$P_w(\text{IRR}) = -70,000 + 30,000 (P/A \ i\%, 5) + 32,000 (P/F \ i\%, 6)$$

$$P_w(30\%) = \$9696.73$$

$$P_w(40\%) = -\$4695.15$$

By using **interpolation**  $\text{IRR} = 36.74\%$  which is  $P_w$  equals to Zero

Since  $\text{IRR} > \text{MARR}$ , the project is economically attractive.

**Ex.2** Consider the following cash flow profile and assume MARR is 10% per year compounded annually.

EOY	0	1	2	3	4	5	6
NCF	-\$100,000	\$25,000	\$25,000	\$25,000	\$25,000	\$25,000	\$25,000

- Determine the ERR for this project.
- Is this project economically attractive?

### Solution

$$(+)\text{Fw (MARR)} = (-)\text{Fw (ERR)}$$

$$25,000 (F/A 10\%, 6) = 100,000 (1 + ERR)^6$$

$$25,000 (7.71561) = 100,000 (1 + ERR)^6 \quad \Rightarrow ERR = 11.57\%$$

Since  $ERR > MARR$ , the project is economically attractive.

**Ex.3** The engineering team at a company is planning to purchase an enterprise resource planning (ERP) system. The software and installation from Vendor **A** costs **\$380,000** initially and is expected to increase revenue **\$125,000** per year every year. The software and installation from Vendor **B** costs **\$280,000** and is expected to increase revenue **\$95,000** per year. The company uses a 4-year planning horizon and a 10 percent per year MARR. (The “do nothing” alternative is feasible) Which ERP system should be purchased based on **IRR & ERR** analyses?

## Solution

### Incremental Approach IRR Method

- Order alternatives from lowest to highest initial investment
- Determine incremental cash flows between alternatives
- Calculate **IRR** on incremental cash flows

$$Pw)_{\mathbf{B-DN}} = -280,000 + 95,000(P/A \text{ IRR}\%, 4) = 0 \Rightarrow \mathbf{IRR = 13.44\%}$$

Since  $\text{IRR})_{\mathbf{B-DN}} > \text{MARR}$ , therefore B is better than doing nothing

$$Pw)_{\mathbf{A-B}} = -100,000 + 30,000(P/A \text{ IRR}\%, 4) = 0 \Rightarrow \mathbf{IRR = 7.71\%}$$

Since  $\text{IRR})_{\mathbf{A-B}} < \text{MARR}$ , therefore B is better than A

## Solution

### Incremental Approach ERR Method

- Order alternatives from lowest to highest initial investment
- Determine incremental cash flows between alternatives
- Calculate **ERR** on incremental cash flows

$$95,000 \frac{(1+0.1)^4 - 1}{0.1} = 280,000 (1 + ERR_{B-DN})^4 \Rightarrow ERR=12\%$$

Since  $ERR_{B-DN} > MARR$ , therefore B is better than doing nothing

$$30,000 \frac{(1+0.1)^4 - 1}{0.1} = 100,000 (1 + ERR_{A-B})^4 \Rightarrow ERR=8.63\%$$

Since  $ERR_{A-B} < MARR$ , therefore B is better than A

**The END**
