Chapter 10: Ionizing Radiation  
Week n° 14

This presentation has been prepared by: Pr. Nabil BEN NESSIB

## Chapter 10: Ionizing Radiation

- We will learn in this chapter 10:
- Interaction of Radiation with Matter
- Radiation Units

King Saud University, College of Science, Physics & Astronomy Dept. Phys 145 (General Physics) © 2014

## Interaction of radiation with matter

- There are four major categories of radiation of interest to us.
- In order of increasing range in matter, there are:
  1. Positive ions, such alpha particles.
  2. Electrons and positrons
  3. Photons (gamma and X rays)
  4. Neutrons

## Energy loss rate

- An ion traveling through a medium collides repeatedly with atomic electrons and gradually loses energy.
- In a given medium, the energy  $\Delta K$  lost per unit distance by an ion with charge  $q$  and velocity  $v$  is proportional to the square of  $q/v$ .

$$\Delta K \propto -\frac{q^2}{v^2} \quad \text{or} \quad \Delta K = -C_o \frac{q^2}{v^2}$$

- This energy is also proportional to the density of atomic electrons in the medium (different  $C_o$  for different medium).
- The minus sign indicates that the ion is losing kinetic energy.
- Using that the kinetic energy of the ion is:  $K = \frac{mv^2}{2}$
- We find:  $\Delta K = -C_o \frac{mq^2}{2K}$

### Radiation unit

Four types of radiation measurements are used in various applications:

1. Source activity
2. Exposure
3. Absorbed dose
4. Biologically equivalent dose

6

### Radiation unit

#### Source activity

The **activity** is related to the **half-life** by:

$$A = \lambda N = \frac{0.693}{T} N$$

The SI **source activity unit** is the **becquerel** (Bq), which is: 1 disintegration per second.

$$1 \text{ Bq} = 1 \text{ disintegration/s}$$

We can use the curie (Ci) also:

$$1 \text{ Ci} = 3.70 \times 10^{10} \text{ disintegrations/s}$$

7

### Radiation unit

#### Exposure

Four types of radiation measurements are used in various applications:

Exposure is defined as the amount of ionization produced in a unit mass of dry air at standard temperature and pressure (STP: 1 atmosphere and 0 Celsius).

The unit of **exposure** is the **roentgen** (R):

$$2.58 \times 10^{-4} \quad 1\text{R} = 2.58 \times 10^{-4} \text{ C/kg}$$

Exposure is defined only for X rays and gamma rays with energies up to 3 MeV and not for other types of radiation. Thus 1 R of X rays will produce  $2.58 \times 10^{-4}$  of positive ions in a kilogram of air at STP, and an equal amount of negative ions.

$$1 \text{ R} = 2.58 \times 10^{-4} \text{ coulomb per kilogram}$$

8

## Radiation unit

### Absorbed dose

The absorbed dose is the energy imparted by ionizing radiation to a unit mass of absorbing tissue.

The SI unit for **adsorbed dose** is the **gray** (Gy), which is defined as 1 joule per kilogram.

$$1 \text{ Gy} = 1 \text{ J/kg}$$

Another unit is the rad, which is defined as 0.01 joule per kilogram. Thus:

$$1 \text{ Gy} = 100 \text{ rad}$$

*Absorbed dose is used with all kinds of ionizing radiation.*

## Radiation unit

### Biologically equivalent dose

The effects of radiation on biological systems depends on the type of radiation and its energy.

Each radiation has a **quality factor** (QF) associated with it. This factor is defined **by comparing its effect** to those of a standard kind of radiation, which is usually taken to be **200-keV X rays**.

For example, fast neutrons have a quality factor equal to 10 for causing cataracts. This means that the dose of 200-keV X rays needed to produce cataracts is 10 times the dose required for neutrons.

The QF varies with animal species and the biological effect under consideration.

## Radiation unit

### Biologically equivalent dose

The units used in discussion of biological effects are:  
In SI system the sievert (Sv) and the rem.

The **biologically equivalent dose** in **sieverts** units (SI) is given by the **product** of the **physical absorbed dose in grays** times the **QF**.

The **biologically equivalent dose** in **rems** is given by the **product** of the **physical absorbed dose in rads** times the **QF**.

## Summary of week 14

The energy loss rate formula is:  $\Delta K \propto -\frac{mq^2}{2K}$

We have the conversion formula:

$$1 \text{ Gy} = 1 \text{ J/kg} = 100 \text{ rad}$$

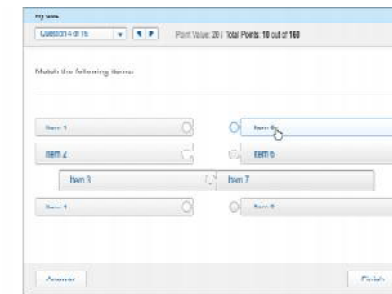

Radiation damage is measured using dosimetry.

Effect of absorbed dose depends on type of radiation.
