

Nursing Research (412 NURS) Hypotheses Exercise

Student Name:

Student's ID:

Hypothesis	Population	Variables		Type of Hypothesis (select all applied)			
		Ind. V	Dep. V	Simple	Complex	Causal	Associative
1. The infants born to heroin-addicted mothers have lower birth weights than infants of non-addicted mothers.							
2. There is a relationship between tactile and auditory stimulation and heart rate response in premature infants.							
3. Older nurses are less likely to express approval of the expanding role of nurses than younger nurses							
4. Structured preoperative support is more effective in reducing surgical patients perception of pain and requests for analgesics than structured post operative support							
5. Teenage girls are better informed about the risks of STD than teenage boys							

Hypothesis	Population	Variables		Type of Hypothesis (select all applied)			
		Ind. V	Dep. V	Simple	Complex	Causal	Associative
6. Nurses who are scheduled by the block rotation method will have a lower number of reported sick days and express a higher level of job satisfaction than nurses scheduled by a random rotation method							
7. Nursing students who have been with a patient who dies will be more likely to report a physical complaint within 72 hours than students who have not had this experience.							
8. Patients who receive a copy of the "patient's Bill of Rights" ask more questions about their treatment and diagnosis than those who do not receive this document.							
9. Patients who have a primary nurse assigned to them on admission report a more favorable impression of their nursing care than patients who do not have a primary nurse assigned on admission							
10. Physicians spend less time explaining treatment plans to patients than do nurse practitioners							

Your trial is highly appreciated 😊😊😊
