## Chapter 3: Some Basic Probability Concepts

### 3.1 General view of probability

Probability: The probability of some event is the likelihood (chance) that this event will occur.
An experiment: Is a description of some procedure that we do.
The universal set ( $\Omega$ ): Is the set of all possible outcomes,
An event: Is a set of outcomes in $\Omega$ which all have some specified characteristic.

Notes:

1. $\quad \Omega$ (the universal set) is called sure event
2. $\phi$ (the empty set) is called impossible event

## Example (3.1)

Consider a set of 6 balls numbered $1,2,3,4,5$, and 6 . If we put the sex balls into a bag and without looking at the balls, we choose one ball from the bag, then this is an experiment which is has 6 outcomes.

- $\boldsymbol{\Omega}=\{1,2,3,4,5,6\}$
- Consider the following events
$-E_{1}=$ the event that an even number occurs $=\{2,4,6\}$.
$-E_{2}=$ the event of getting number greater than $2=\{3,4,5,6\}$.
$-\mathrm{E}_{3}=$ the event that an odd number occurs $=\{1,3,5\}$.
$-\mathrm{E}_{4}=$ the event that a negative number occurs $=\{ \}=\phi$.

## Equally likely outcomes:

The outcomes of an experiment are equally likely if they have the same chance of occurrence.

## Probability of equally likely events

consider an experiment which has N equally likely outcomes, and let the numbers of outcomes in an event E given by $\boldsymbol{n}(\boldsymbol{E})$, then the probability of $E$ is given by

$$
P(E)=\frac{n(E)}{n(\Omega)}=\frac{n(E)}{N}
$$

## Notes

1. For any event $\mathrm{A}, 0 \leq \mathrm{P}(\mathrm{A}) \leq 1$ (why?)

That is, probability is always between 0 and 1 .
2. $\mathrm{P}(\Omega)=1$, and $\mathrm{P}(\phi)=0$ (why?)

1 means the event is a certainty, 0 means the event is impossible

## Example (3.2)

In the ball experiment we have
$\mathrm{n}(\Omega)=6, \mathrm{n}\left(\mathrm{E}_{1}\right)=3, \mathrm{n}\left(\mathrm{E}_{2}\right)=4, \mathrm{n}\left(\mathrm{E}_{2}\right)=3$

$$
\mathrm{P}\left(\mathrm{E}_{1}\right)=3 / 6=0.5
$$

$$
\mathrm{P}\left(\mathrm{E}_{2}\right)=4 / 6=0.667
$$

$$
\mathrm{P}\left(\mathrm{E}_{3}\right)=3 / 6=0.5
$$

$$
\mathrm{P}\left(\mathrm{E}_{4}\right)=0
$$

## Repaper that

- $\quad E_{1}=$ the event that an even number occurs $=\{2,4,6\}$.
$-\quad E_{2}=$ the event of getting number greater than $2=\{3,4,5,6\}$.
- $E_{3}=$ the event that an odd number occurs $=\{1,3,5\}$.
- $E_{4}=$ the event that a negative number occurs= $\}=$

## Relationships between events

Union : $\mathrm{A} \cup \mathrm{B}$, consists of all those outcomes in A or in B or in both A and B

$$
A \cup B
$$

* Intersection : A $\cap \mathrm{B}$, consists of all those outcomes in both A and B

* Complement : $\mathrm{A}^{\mathrm{c}}$ (or A`)

Consists of all outcomes that are in $\Omega$ but not in A

Notes:
$1-n(A \cup B)=n(A)+n(B)-n(A \cap B)$ and hence
$P(A \cup B)=P(A)+P(B)-P(A \cap B)$

2. $n\left(A^{\mathrm{c}}\right)=\mathrm{n}(\Omega)-\mathrm{n}(\mathrm{A})$

So that
$\mathrm{P}\left(\mathrm{A}^{\mathrm{c}}\right)=1-\mathrm{P}(\mathrm{A})$

Sets (events) can be represented by Venn Diagram

## A Venn Diagram:

## Disjoint events

Two events A and B are said to be disjoint (mutually exclusive) if $\mathrm{A} \cap \mathrm{B}=\phi$.

- In the case of disjoint events
$\mathrm{P}(\mathrm{A} \cap \mathrm{B})=0$
$P(A \cup B)=P(A)+P(B)$

## Example 3.3

From a population of 80 babies in a certain hospital in the last month, let the even $\mathrm{B}=$ "is a boy", and $\mathrm{O}=$ "is over weight" we have the following incomplete Venn diagram.

- It is a boy
$\mathrm{P}(\mathrm{B})=(3+39) / 80=0.525$
- It is a boy and overweight $\mathrm{P}(\mathrm{B} \cap \mathrm{O})=3 / 80=0.0357$

- It is a boy or it is overweight
$\mathrm{P}(\mathrm{B} \mathrm{U} \mathrm{O})=(39+3+7) / 80=0.6125$

Conditional probability:
the conditional probability of $A$ given $B$ is equal to the probability of
$A \cap B$ divided by the probability of $B$, providing the probability of $B$ is not zero.
That is
$\mathrm{P}(\mathrm{A} \mid \mathrm{B})=\mathrm{P}(\mathrm{A} \cap \mathrm{B}) / \mathrm{P}(\mathrm{B}), \mathrm{P}(\mathrm{B}) \neq 0$
Notes:

1. $\mathrm{P}(\mathrm{A} \mid \mathrm{B})$ is the probability of the event A if we know that the event B has occurred
2. $\mathrm{P}(\mathrm{B} \mid \mathrm{A})=\mathrm{P}(\mathrm{A} \cap \mathrm{B}) / \mathrm{P}(\mathrm{A}), \mathrm{P}(\mathrm{A}) \neq 0$

## Example

Referring to example 3.3 what is the probability that

- He is a boy knowing that he is over weight?
$P(B \mid O)=P(B \cap O) / P(O)=(3 / 80) /(10 / 80)=3 / 10=0.3$
- If we know that she is a girl, what is the probability that she is not overweight?

$$
P\left(O^{c} \mid B^{c}\right)=P\left(B^{c} \cap O^{c}\right) / P\left(B^{c}\right)=(31 / 80) /[(7+31) / 80]=31 / 38=0.716
$$

## Independent events

-Two events A and B are said to be independent if the occurrence of one of them has no effect on the occurrence of the other.

Multiplication rule for independent events
-If A and B are independent then
$1-P(A \cap B)=P(A) P(B)$
$2-\mathrm{P}(\mathrm{A} \mid \mathrm{B})=\mathrm{P}(\mathrm{A})$ (Why?)
3- $\mathrm{P}(\mathrm{B} \mid \mathrm{A})=\mathrm{P}(\mathrm{B})$ (Why?)

## Example 3.4

In a population of people with a certain disease, let $\mathrm{M}=$ "Men" and S="suffer from swollen leg "
We have the following incomplete Venn diagram
If we randomly choose one person

- Complete the Venn diagram
- Find the probability that this person

1- Is a man and suffer from swollen leg ?

$\mathrm{P}(\mathrm{M} \cap \mathrm{S})=0.34$
2-Is a women?
$\mathrm{P}\left(\mathrm{M}^{\mathrm{c}}\right)=0.38+0.03=0.41 \quad\left(\right.$ or $\left.\mathrm{P}\left(\mathrm{M}^{\mathrm{c}}\right)=1-\mathrm{P}(\mathrm{M})=1-(0.25+0.34)=0.41\right)$
3- Is a women that does not suffer from swollen leg ?
$\mathrm{P}\left(\mathrm{M}^{\mathrm{c}} \cap \mathrm{S}^{\mathrm{c}}\right)=0.38$
4- Does not suffering from swollen leg?

$$
\mathrm{P}\left(\mathrm{~S}^{\mathrm{c}}\right)=0.25+0.38=0.63
$$

## Marginal prbability:

Definition: Given some variable that can be broken down into m categories designated by $\mathrm{A}_{1}, \mathrm{~A}_{2}, \ldots, \mathrm{~A}_{\mathrm{m}}$ and another jointly accurance variable that is broken down into n categories designated by $\mathrm{B}_{1}, \mathrm{~B}_{2,}, \ldots, \mathrm{~B}_{\mathrm{n}}$, the marginal probability of $\mathrm{A}_{\mathrm{i}}$, called $\mathrm{P}\left(\mathrm{A}_{\mathrm{i}}\right)$, is equal to the sum of the joint probabilities of $A_{i}$ with all categories of $B$. That is
$P\left(A_{i}\right)=\sum P\left(A_{i} \cap B_{j}\right)$, for all values of $j$.
This will be clear in the following example
Example 3.5:
The following table shows 1000 nursing school applicants classified according to scores made on a college entrance examination and the quality of the high school form which they graduated, as rated by the group of educators.

| $\begin{aligned} & 0 \\ & 0 \\ & 0 \\ & 0 \\ & \hline \end{aligned}$ |  | Quality of high school |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Poor <br> (p) | Average <br> (A) | Superior <br> (S) | total |
|  | Low (L) | 105 | 60 | 55 | 220 |
|  | Medium (M) | 70 | 175 | 145 | 390 |
|  | High (H) | 25 | 65 | 300 | 390 |
|  | total | 200 | 300 | 500 | 1000 |

- Q1-How many marginal probabilities can be calculated from these data? State each probability notation and do calculations.
- 6 marginal probabilities, $\mathrm{P}(\mathrm{L}), \mathrm{P}(\mathrm{M}), \mathrm{P}(\mathrm{H}), \mathrm{P}(\mathrm{p}), \mathrm{P}(\mathrm{A}), \mathrm{P}(\mathrm{S})$.
- Q2-Calculate the probability that an applicant picked at random from this group:
1-Made a low score on the examination

$$
P(L)=220 / 1000=0.22
$$

2- Graduated from superior high school.
$P(S)=500 / 1000=0.5$

3- Made a low score on the examination given that he or she graduated from Superior high school
$\mathrm{P}(\mathrm{L} \mid \mathbf{S})=\mathrm{P}(\mathrm{L} \cap \mathrm{S}) / \mathrm{P}(\mathrm{S})=(55 / 1000) /(500 / 1000)=55 / 500=0.11$

5- Made a high score or graduated from a superior high school.
$\mathrm{P}(\mathrm{H} \cup \mathrm{S})=\mathrm{P}(\mathrm{H})+\mathrm{P}(\mathrm{S})-\mathrm{P}(\mathrm{H} \cap \mathrm{S})=(390+500-300) / 1000=0.59$

- Calculate the following probabilities

1. $\mathrm{P}(\mathrm{A})=300 / 1000=0.3$
2. $\mathrm{P}(\mathrm{S})=500 / 1000=0.5$
3. $\mathrm{P}(\mathrm{M})=390 / 1000=0.39$
4. $\mathrm{P}(\mathrm{M} \cap \mathrm{P})=70 / 1000=0.07$
5. $\mathrm{P}(\mathrm{A} \cup \mathrm{L})=(300+220-60) / 1000=0.46$
6. $\mathrm{P}(\mathrm{P} \cap \mathrm{S})=0$
7. $\mathrm{P}(\mathrm{LUH})=(220+390) / 1000=0.61$
8. $\mathrm{P}(\mathrm{H} / \mathrm{S})=300 / 500=0.6$

| $\begin{gathered} 0 \\ 0 \\ \text { Un } \end{gathered}$ |  | Quality of high school |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | P | A | S | total |
|  | L | 105 | 60 | 55 | 220 |
|  | M | 70 | 175 | 145 | 390 |
|  | H | 25 | 65 | 300 | 390 |
|  | total | 200 | 300 | 500 | 1000 |

## Chapter 4: Probability Distribution

### 4.1 Probability Distribution of Discrete Random Variables

- Random variable: is a variable that measured on population where each element must have an equal chance of being selected.
- let X be a discrete random variable, and suppose we are able to count the number of population where $X=x$, then the value of $x$ together with the probability $\mathbf{P ( X = x )}$ are called probability distribution of the discrete random variable $X$.

Example 4.1
Suppose we measure the number of complete days that a patient spends in the hospital after a particular type of operation in Dammam hospital in one year, obtaining the following results.

| Number of days, $x$ | Frequency |
| :---: | :---: |
| 1 | 5 |
| 2 | 22 |
| 3 | 15 |
| 4 | 8 |
| N | 50 |

The probability of the event $\{X=x\}$ is the relative frequency
$\mathrm{P}(\mathrm{X}=\mathrm{x})=\frac{n(X=x)}{n(S)}=\frac{n(X=x)}{N}$
That is: $\mathrm{P}(\mathrm{X}=1)=5 / 50=0.1$
$\mathrm{P}(\mathrm{X}=2)=22 / 50=0.44$
$\mathrm{P}(\mathrm{X}=3)=15 / 50=0.3$
$\mathrm{P}(\mathrm{X}=4)=8 / 50=0.16$

- What is the value of $\sum \mathrm{P}(\mathrm{X}=\mathrm{x})$ ?

| Number of days, $x$ | $\mathrm{P}(\mathrm{X}=x)$ |
| :---: | :---: |
| 1 | 0.1 |
| 2 | 0.44 |
| 3 | 0.3 |
| 4 | 0.16 |
| Sum | 1 |

The probability distribution must satisfy the conditions

$$
\begin{aligned}
& \text { 1- } 0 \leq P(X=x) \leq 1 \\
& 2-\sum P(X=x)=1
\end{aligned}
$$

The first condition must be satisfied since $\mathrm{P}(\mathrm{X}=x)$ is a probability, and the second condition must be satisfied since the events $\{\mathrm{X}=x\}$ are mutually exclusive and there union is the sample space.
-Population mean for a discrete random variable: If we know the distribution function $\mathrm{P}(\mathrm{X}=\mathrm{x})$ for each possible value x of a discrete random variable, then the population mean (or the expected value of the random variable X ) is

$$
\mu=\sum x P(X=x)
$$

Example: The expected number of complete days that a patient spends in the hospital after a particular type of operation in Dammam hospital in one year (example 3.1) is

$$
\mu=\sum x P(X=x)=1(0.1)+2(0.44)+3(0.3)+4(0.16)=2.52
$$

-Cumulative distributions : the cumulative distribution or the cumulative probability distribution of a random variable is $P(X \leq x)$
It is obtained in a way similar to finding the cumulative relative frequency distribution for samples.
-referring to example 3.1
$\mathrm{P}(\mathrm{X} \leq 1)=0.1$
$P(X \leq 2)=P(X=1)+P(X=2)=0.1+0.44=0.54$
$\mathrm{P}(\mathrm{X} \leq 3)=\mathrm{P}(\mathrm{X}=1)+\mathrm{P}(\mathrm{X}=2)+\mathrm{P}(\mathrm{X}=3)=0.1+0.44+0.3=0.84$
$\mathrm{P}(\mathrm{X} \leq 4)=\mathrm{P}(\mathrm{X}=1)+\mathrm{P}(\mathrm{X}=2)+\mathrm{P}(\mathrm{X}=3)+\mathrm{P}(\mathrm{X}=4)=0.1+0.44+0.3+0.16=1$
The cumulative probability distribution can be displayed in the following table

| Number of days <br> $x$ | $\mathrm{P}(\mathrm{X}=x)$ | $\mathrm{P}(\mathrm{X} \leq x)$ |
| :---: | :---: | :---: |
| 1 | 0.1 | 0.1 |
| 2 | 0.44 | 0.54 |
| 3 | 0.3 | 0.84 |
| 4 | 0.16 | 1 |
| Sum | 1 |  |

-From the table find:
$1-\mathrm{P}(\mathrm{X}<3)=\mathrm{P}(\mathrm{X} \leq 2)=0.54$
$2-\mathrm{P}(2 \leq \mathrm{X} \leq 4)=\mathrm{P}(\mathrm{X}=4)+\mathrm{P}(\mathrm{X}=3)+\mathrm{P}(\mathrm{X}=2)=0.9$
Or $\mathrm{P}(2 \leq \mathrm{X} \leq 4)=\mathrm{P}(\mathrm{X} \leq 4)-\mathrm{P}(\mathrm{X}<2)=1-0.1=0.9$
$3-\mathrm{P}(\mathrm{X}>2)=\mathrm{P}(\mathrm{X}=3)+\mathrm{P}(\mathrm{X}=4)=0.46$
Or $\mathrm{P}(\mathrm{X}>2)=1-\mathrm{P}(\mathrm{X} \leq 2)=1-0.54=0.46$

In general we can use the following rules for integer number $a$ and $b$
$1-\mathrm{P}(\mathrm{X} \leq \mathrm{a})$ is a cumulative distribution probability
$2-P(X<a)=P(X \leq a-1)$
$3-\mathrm{P}(\mathrm{X} \geq \mathrm{b})=1-\mathrm{P}(\mathrm{X}<\mathrm{b})=1-\mathrm{P}(\mathrm{X} \leq \mathrm{b}-1)$
$4-\mathrm{P}(\mathrm{X}>\mathrm{b})=1-\mathrm{P}(\mathrm{X} \leq \mathrm{b})$
5- $\mathrm{P}(\mathrm{a} \leq \mathrm{X} \leq \mathrm{b})=\mathrm{P}(\mathrm{X} \leq \mathrm{b})-\mathrm{P}(\mathrm{X}<\mathrm{a})=\mathrm{P}(\mathrm{X} \leq \mathrm{b})-\mathrm{P}(\mathrm{X} \leq \mathrm{a}-1)$
6- $\mathrm{P}(\mathrm{a}<\mathrm{X} \leq \mathrm{b})=\mathrm{P}(\mathrm{X} \leq \mathrm{b})-\mathrm{P}(\mathrm{X} \leq \mathrm{a})$
7- $\mathrm{P}(\mathrm{a} \leq \mathrm{X}<\mathrm{b})=\mathrm{P}(\mathrm{X} \leq \mathrm{b}-1)-\mathrm{P}(\mathrm{X} \leq \mathrm{a}-1)$
8- $\mathrm{P}(\mathrm{a}<\mathrm{X}<\mathrm{b})=\mathrm{P}(\mathrm{X} \leq \mathrm{b}-1)-\mathrm{P}(\mathrm{X} \leq \mathrm{a})$

### 4.2 Binomial Distribution

The binomial distribution is a discrete distribution that is used to model the following experiment
1-The experiment has a finite number of trials $n$.
2- Each single trial has only two possible (mutually exclusive )outcomes of interest such as recovers or doesn't recover; lives or dies; needs an operation or doesn't need an operation. We will call having certain characteristic success and not having this characteristic failure.
3 - The probability of a success is a constant $\pi$ for each trial. The probability of a failure is $1-\pi$.

4- The trials are independent; that is the outcome of one trial has no effect on the outcome of any other trial.
Then the discrete random variable $\underline{X=\text { the number of successes in } n \text { trials has a }}$
Binomial $(\mathrm{n}, \pi)$ distribution for which the probability distribution function is given by

$$
\mathrm{P}(\mathrm{X}=x)= \begin{cases}\binom{n}{x} \pi^{x}(1-\pi)^{n-x} & x=0,1,2, \ldots, n \\ \mathbf{O} & \text { otherwise }\end{cases}
$$

$\begin{aligned} & \text { Where } \\ & \text { Note }\end{aligned}\binom{n}{x}=\frac{n!}{x!(n-x)!}$
If the discrete random variable $X$ has a binomial distribution, we write
$X \sim \operatorname{Bin}(n, \pi)$
The mean and variance for the binomial distribution:

- The mean for a $\operatorname{Binomial}(\mathrm{n}, \pi)$ random variable is $\mu=\Sigma x P(X=x)=n \pi$

$$
\text { The variance } \quad \sigma^{2}=n \pi(1-\pi)
$$

## Example 4.2

Suppose that the probability that Saudi man has a high blood pressure is 0.15 .
If we randomly select 6 Saudi men.
a- Find the probability distribution function for the number of men out of 6 with high blood pressure.
b- Find the probability that there are 4 men with high blood pressure?
c-Find the probability that all the 6 men have high blood pressure?
d-Find the probability that none of the 6 men have high blood pressure?
$\mathrm{e}-$ what is the probability that more than two men will have high blood pressure?
f-Find the expected number of high blood pressure.

## Solution:

Let $X=$ the number of men out of 6 with high blood pressure.
Then $X$ has a binomial distribution ( why ?).
Success $=$ The man has a high blood pressure
Failure $=$ The man doesn't have a high blood pressure
Probability of success $=\pi=0.15$ and hence Probability of failure $=1-\pi=0.85$
Number of trials $=\quad n=6$

$$
\mathrm{n}=6, \pi=0.15, \quad 1-\pi=0.85
$$

- Then X has a Binomial distribution , $X \sim \operatorname{Bin}(6,0.15)$
a the probability distribution function is $\quad \begin{aligned} & P(X=x)=\binom{6}{x} 0.15^{x}(0.85)^{6-x} \\ & x=0,1, \ldots, 6\end{aligned}$
b- the probability that 4 men will have high blood pressure
$P(X=4)=\binom{6}{4} 0.15^{4}(0.85)^{2}=(15)(0.15)^{4}(0.85)^{2}=0.00549$
C- the probability that all the 6 men have high blood pressure

$$
\mathrm{P}(\mathrm{X}=6)=\binom{6}{6} 0.15^{6}(0.85)^{0}=0.15^{6}=0.00001
$$

d-the probability that none of 6 men have high blood pressure is
$\mathrm{P}(\mathrm{X}=0)=\binom{6}{0} 0.15^{0}(0.85)^{6}=0.85^{6}=0.37715$
e- the probability that more than two men will have high blood pressure is

$$
\mathrm{P}(\mathrm{X}>2)=1-\mathrm{P}(\mathrm{X} \leq 2)=1-[\mathrm{P}(\mathrm{X}=0)+\mathrm{P}(\mathrm{X}=1)+\mathrm{P}(\mathrm{X}=2)]
$$

$$
\begin{aligned}
& =1-\left[0.37715+\binom{6}{1} 0.15^{1}(0.85)^{5}+\binom{6}{2} 0.15^{2}(0.85)^{4}\right] \\
& =1-[0.37715+0.39933+0.17618]=1-0.95266=0.04734
\end{aligned}
$$

F- the expected number of high blood pressure is $\quad \mu=n \pi=6(0.15)=0.9$

$$
\text { and the variance is } \sigma^{2}=n \pi(1-\pi)=6(0.15)(0.85)=0.765
$$

### 4.3 The Poisson Distribution

The Poisson distribution is a discrete distribution that is used to model the random variable $X$ that represents the number of occurrences of some random event in the interval of time or space.
The probability that X will occur ( the probability distribution function ) is given by:

$$
P(X=x)= \begin{cases}\frac{e^{-\lambda} \lambda^{x}}{x!}, & x=0,1,2, \ldots \ldots \\ 0 & \text { otherwise }\end{cases}
$$

$\lambda$ is the average number of occurrences of the random variable in the interval.
The mean
The variance $\quad \sigma^{2}=\lambda$
If X has a Poisson distribution we write $\mathbf{X} \sim \operatorname{Poiss} o n(\lambda)$

## Examples of Poisson distribution:

- The number of patients in a waiting room in an hour.
- The number of serious injuries (الاصابات الخطبرة) in a particular factory in a year.
- The number of times a three year old child has an ear infection (عدوى الأذن) in a year.
- Example 4.3:

Suppose we are interested in the number of snake bite (لاغة الأفعى) cases seen in a particular Riyadh hospital in a year. Assume that the average number of snake bite cases at the hospital in a year is $\mathbf{6}$.
1 - What is the probability that in a randomly chosen year, the number of snake bites cases will be 7 ?
2 - What is the probability that the number of cases will be less than 2 in 6 months?
3 -What is the probability that the number of cases will be 13 in 2 year ?
4- What is Expected number of snake bites in a year? What is the variance of snake bites in a year?

## Solution:

$\mathrm{X}=$ number of snake bite cases seen at this hospital in a year. And the mean is 6
Then X~ Poisson (6)

## First note the following

- The average number of snake bite cases at the hospital in a year $=\lambda=6$ X~ Poisson (6)
- The average number of snake bite cases at the hospital in 6 months $=$ $=$ the average number of snake bite cases at the hospital in $(1 / 2)$ year $=(1 / 2) \lambda=3$

Y~Poisson (3)

- The average number of snake bite cases at the hospital in $\underline{2}$ years $=2 \lambda=12$

1- The probability that the number of snake bites will be 7 in $\underline{\text { y year }}$

$$
\begin{array}{r}
P(X=x)=\frac{e^{-6} 6^{x}}{x!}, \quad x=0,1,2, \ldots \\
P(X=7)=\frac{e^{-6} 6^{7}}{7!}=0.138
\end{array}
$$

2- _The probability that the number of cases will be less than 2 in 6 months

$$
\begin{aligned}
& P(Y=y)=\frac{e^{-3} 3^{y}}{y!}, y=0,1,2 \ldots \\
& \begin{aligned}
P(Y<2) & =P(Y=0)+P(Y=1) \\
& =\frac{e^{-3} 3^{0}}{0!}+\frac{e^{-3} 3^{1}}{1!}=0.0498+0.1494=0.1992
\end{aligned}
\end{aligned}
$$

3- The probability that the number of cases will be 13 in $\underline{2}$ years

$$
\begin{aligned}
& P(V=v)=\frac{e^{-12} 12^{v}}{v!} \\
& P(V=13)=\frac{e^{-12} 12^{13}}{13!}=0.1056
\end{aligned}
$$

$$
\lambda^{* *}=12
$$

Remember If $\mathrm{X} \sim$ Poisson ( $\lambda$ )

$$
P(X=x)=\frac{e^{-\lambda} \lambda^{x}}{x!}
$$

4- the expected number of snake bites in a year: $\mu=\lambda=6$ the variance of snake bites in a year:

$$
\sigma^{2}=\lambda=6
$$

### 4.4 Probability Distribution of Continuous Random Variable

 If X is a continuous random variable, then there exist a function $f(X)$ called probability density function that has the following properties:1- The area under the probability curve $f(x)=1$

$$
\text { area }=\int_{-\infty}^{\infty} f(x) d x=1
$$

2- Probability of interval events are given by areas under the probability curve

$$
\mathrm{P}(\mathrm{a} \leq \mathrm{X} \leq \mathrm{b})=\int_{a}^{b} f(x) d x
$$

$\mathrm{P}(\mathrm{X} \geq \mathrm{a}) \int_{a}^{\infty} f(x) d x$

$\mathrm{P}(\mathrm{X} \leq \mathrm{a})=\int_{-\infty}^{a} f(x) d x$

3- $\mathrm{P}(\mathrm{X}=\mathrm{a})=0$ (why?)
4- $\mathrm{P}(\mathrm{X} \geq \mathrm{a})=\mathrm{P}(\mathrm{X}>\mathrm{a})$ and $\mathrm{P}(\mathrm{X} \leq \mathrm{a})=\mathrm{P}(\mathrm{X}<\mathrm{a})$
7- $\mathrm{P}(\mathrm{X} \leq \mathrm{a})=\mathrm{P}(\mathrm{X}<\mathrm{a})$ is the cumulative probability
5- $\mathrm{P}(\mathrm{X} \geq \mathrm{a})=1-\mathrm{P}(\mathrm{X} \leq \mathrm{a})$
$6-\mathrm{P}(\mathrm{a}<\mathrm{X}<\mathrm{b})=\mathrm{P}(\mathrm{X}<\mathrm{b})-\mathrm{P}(\mathrm{X}<\mathrm{a})$

### 4.5 The Normal Distribution:

The normal distribution is one of the most important continuous distribution in statistics.
It has the following characteristics
$1-\mathrm{X}$ takes values from $-\infty$ to $\infty$.
2 - The population mean is $\mu$ and the population variance is $\sigma^{2}$, and we write $X \sim N\left(\mu, \sigma^{2}\right)$.
3- The graph of the density of a normal distribution has a bell shaped curve, that is symmetric about $\mu$

4- $\mu=$ mean $=$ mode $=$ median of the normal distribution.
5-The location of the distribution depends on $\mu$ (location parameter).
The shape of the distribution depends on $\sigma$ (shape parameter).

$\mu_{1}<\mu_{2}$

$\sigma_{1}>\sigma_{2}$

## Standard normal distribution:

- The standard normal distribution is a normal distribution with mean $\mu=0$ and variance $\sigma^{2}=1$.

## Result

- If $X \sim N\left(\mu, \sigma^{2}\right)$ then

$$
\mathrm{Z}=\frac{\mathrm{X}-\mu}{\sigma} \sim \mathrm{N}(0,1) .
$$

## Notes

- The probability $\mathrm{A}=\mathrm{P}\left(\mathrm{Z}_{\leq} \mathrm{z}\right)$ is the area to the left of z under the standard normal curve.
-There is a Table gives values of $\underline{\mathrm{P}\left(\mathrm{Z}_{\leq \mathrm{z}}\right)}$ for different values of z .

## Calculating probabilities from Normal $(0,1)$

- $\mathrm{P}(\mathrm{Z} \leq \mathrm{z})$ From the table ( the area under the curve to the left of z )

- $\mathrm{P}(\mathrm{Z} \geq \mathrm{z})=1-\mathrm{P}(\mathrm{Z} \leq \mathrm{z})$
$\uparrow$ From the table ( the area under the curve to the right of z )
- $\mathrm{P}\left(\mathrm{z}_{1} \leq \mathrm{Z} \leq \mathrm{z}_{2}\right)=\mathrm{P}_{\uparrow}\left(\mathrm{Z} \leq \mathrm{z}_{2}\right)-\underset{\uparrow}{\mathrm{P}}\left(\mathrm{Z} \leq \mathrm{z}_{1}\right)$ From the table ( the area under the curve between $\mathrm{z}_{1}$ and $\mathrm{z}_{2}$ )

## Notes:

- $\mathrm{P}(\mathrm{Z} \leq 0)=\mathrm{P}(\mathrm{Z} \geq 0)=0.5$ (why?)
- $P(Z=z)=0$ for any $z$.
- $\mathrm{P}(\mathrm{Z} \leq \mathrm{z})=\mathrm{P}(\mathrm{Z}<\mathrm{z})$ and $\mathrm{P}(\mathrm{Z} \geq \mathrm{z})=\mathrm{P}(\mathrm{Z}>\mathrm{z})$
- If $\mathrm{z} \leq-3.49$ then $\mathrm{P}(\mathrm{Z} \leq \mathrm{z})=0$, and if $\mathrm{z} \geq 3.49$ then $\mathrm{P}(\mathrm{Z} \leq \mathrm{z})=1$.

## Example 4.1 :

- $\mathrm{P}(\mathrm{Z} \leq 1.5)=0.9332$
- $\mathrm{P}(-1.33 \leq \mathrm{Z} \leq 2.42)=\mathrm{P}(\mathrm{Z} \leq 2.42)-\mathrm{P}(\mathrm{Z}<1.33)=$

$$
=0.9922-0.0918=0.9004
$$

- $\mathrm{P}(\mathrm{Z} \geq 0.98)=1-\mathrm{P}(\mathrm{Z} \leq 0.98)=1-0.8365=0.1635$

| Z | 0.00 | 0.01 | $\ldots$ |
| :---: | :---: | :---: | :---: |
| $:$ | $\Downarrow$ |  |  |
| $1.5 \Rightarrow$ | 0.933 |  |  |
| $:$ |  |  |  |

## Example 4.2 :

Suppose that the hemoglobin level for healthy adult males are approximately normally distributed with mean 16 and variance of 0.81 . Find the probability that a randomly chosen healthy adult male has hemoglobin level
a) Less than $14 . \quad$ b) Greater than 15 . C) Between 13 and 15

Solution
Let $\mathrm{X}=$ the hemoglobin level for healthy adult male, then $X \sim N\left(\mu=16, \sigma^{2}=0.81\right)$.
a) Since $\mu=16, \sigma^{2}=0.81$, we have $\sigma=$
$\mathrm{P}(\mathrm{X}<14)=\mathrm{P}\left(\mathrm{Z}<\frac{14-\mu}{\sigma}\right)=\mathrm{P}\left(\mathrm{Z}<\frac{14-16}{0.9}\right)=\sqrt{0.81}(\mathrm{Z}<-2.22)=0.0132$
b) $\mathrm{P}(\mathrm{X}>15)=\mathrm{P}\left(\mathrm{Z}>\frac{15-\mu}{\sigma}\right)=\mathrm{P}\left(\mathrm{Z}>\frac{15-16}{0.9}\right)=\mathrm{P}(\mathrm{Z}>-1.11)=1-\mathrm{P}(\mathrm{Z} \leq-1.11)=$.
c) $\begin{aligned} & \mathrm{P}(13<\mathrm{X}<15)=\mathrm{P}(13-\mu \\ & \sigma\left.\frac{\mathrm{Z}}{\sigma}<\frac{15-\mu)}{\sigma}\right)=\mathrm{P}\left(\mathrm{Z}<\frac{15-16}{0.9}\right)-\mathrm{P}(\mathrm{Z}<13-16) \\ &=\mathrm{P}(\mathrm{Z} \leq-1.11)-\mathrm{P}(\mathrm{Z} \leq-9.33)\end{aligned}$ $=0.1335-0=0.1335$.
d) $P(X=13)=0$

## Result(1)

Let $X_{1}, X_{2}, \ldots, X_{n}$ be a random sample of size n from $\underline{\mathrm{N}\left(\mu, \sigma^{2}\right) \text {, then }}$

1) $\bar{X}=\frac{\sum_{i=1}^{n} x_{i}}{n} \sim \mathrm{~N}\left(\mu, \sigma^{2} / n\right)$
2) $z=\frac{\bar{x}-\mu}{\sigma} / \sqrt{n} \sim N(0,1)$.

## Central Limit Theorem

Let $\mathrm{X}_{1}, \mathrm{X}_{2}, \ldots, \mathrm{X}_{\mathrm{n}}$ be a random sample of size n from any distribution with mean $\mu$ and variance $\sigma^{2}$, and if n is large ( $\mathrm{n} \geq 30$ ), then

$$
\mathrm{Z}=\frac{x-\mu}{\sigma / \sqrt{n}} \approx \mathrm{~N}(0,1) .
$$

( that is, Z has approximately standard normal distribution)

## Result (2)

If $\sigma^{2}$ is unknown in the central limit theorem, then $\underline{s}$ ( the sample standard deviation ) can be used instead of $\sigma$, that is

$$
\mathrm{Z}=\frac{x-\mu}{s / \sqrt{n}} \approx \mathrm{~N}(0,1) .
$$

Where $s=\sqrt{\frac{\sum_{i=1}^{n} x_{i}^{2}-n(\bar{x})^{2}}{n-1}}$

## Chapter 5: Statistical Inference

5.1 Introduction: There are two main purposes in statistics
-Organizing and summarizing data (descriptive statistics).
-Answer research questions about population parameter (statistical inference). There are two general areas of statistical inference:

- Hypothesis testing: answering questions about population parameters.
- Estimation: approximating the actual values of population parameters. there are two kinds of estimation:
-Point estimation.
oInterval estimation ( confidence interval).

Here we will consider two types of population parameters

> Population mean: $\mu$ ( for quantitative variable)

Population proportion $\pi$

$\pi=\frac{\text { no. of elementin the population with somecharachtaistic }}{\text { Total no. of elementin the population }}$
$\mu=$ The average ( mean ) value for some qualitative variable.

## Examples:

-The mean life span for some bacteria - The income mean for some bacteria

- The income mean of government employee in Saudi Arabia.

## 5.2: Estimation of Population Mean: $\mu$

1) Point Estimation:

- A point estimate is a single number used to estimate the corresponding population parameter.
- $\bar{x}$ is a point estimate of $\mu$

That is, the sample mean is a point estimate of the population mean.
2) Interval Estimation (Confidence Interval:C.I) of $\mu$

- Definition: (1- $\alpha$ ) $100 \%$ Confidence Interval:
(1- $\alpha$ ) $100 \%$ Confidence Interval is an interval of numbers (L,U), defined by lower $\underline{L}$ and upper $\underline{U}$ limits that contains the population parameter with probability ( $1-\alpha$ ).
$1-\alpha$ : the confidence coefficient.
L: Lower limit of the confidence interval.
U : upper limit of the confidence interval.

Note: The C.I $\bar{x} \pm z_{1-\frac{\alpha}{2}} \frac{\sigma}{\sqrt{n}}$ means
$(\mathrm{L}, \mathrm{U})=\left(\bar{x}-\mathrm{z}_{1-\frac{\alpha}{2}} \frac{\sigma}{\sqrt{n}}, \quad \bar{x}+\mathrm{z}_{1-\frac{\alpha}{2}} \frac{\sigma}{\sqrt{n}}\right)$

- Similarly for $\bar{x}_{\bar{x} \pm \mathrm{z}_{1-\frac{\alpha}{2}} \frac{s}{\sqrt{n}}},(\mathrm{~L}, \mathrm{U})=\left(\bar{x}-\mathrm{z}_{1-\frac{\alpha}{2}} \frac{s}{\sqrt{n}}, \bar{x}+\mathrm{z}_{1-\frac{\alpha}{2}} \frac{s}{\sqrt{n}}\right.$.
- Interpretation of the CI: We are ( $1-\alpha$ ) $100 \%$ confident that the (mean) of (variable) for the (population) is between L and U .

## Example 5.1:

Let $\mathrm{Z} \sim \mathrm{N}(0,1)$

$$
Z_{1-\frac{\alpha}{2}}=? ? ?
$$

Here we have the probability ( the area) and we want to find the exact value of $z$. hence we can use the table of standard normal but in the opposite direction.
a) $\alpha=0.05$
$\alpha / 2=0.025$
$1-\alpha / 2=0.975$

From the standard normal table $Z_{0.975}=1.96$
b) $\alpha=0.1$
$\alpha / 2=0.05$
$1-\alpha / 2=0.95$
$Z_{0.95}=1.645$

| Z | $\ldots$ | 0.06 | $\ldots$ |
| :---: | :---: | :---: | :---: |
| $:$ | $:$ | $\Uparrow$ |  |
| 1.9 | $\Leftarrow \Leftarrow$ | 0.975 |  |
| $:$ |  |  |  |

Example 5.2: On 123 patient of diabetic ketoacidosis (الحماض الكيتوني السكري) patient in Saudi Arabia, the mean blood glucose level was 26.2 with a standard deviation of $3.3 \mathrm{~mm} 01 / \mathrm{l}$. Find the $90 \%$ confidence interval for the mean blood glucose level of such diabetic ketoacidosis patient.

## Solution:

Variable: blood glucose level (in mmol/l)
Population: Diabetic ketoacodosis patient in Saudi Arabia.
Parameter: $\mu$ (the average blood glucose level)
$\mathrm{n}=123, \bar{x}=26.2 \quad \mathrm{~s}=3.3$

- $\sigma^{2}$ unknown, $\mathrm{n}=123>30$ (large) $\Rightarrow$ the $90 \% \mathrm{CI}$ for $\mu$ is given by

$$
\bar{x} \pm z_{1-\frac{\alpha}{2}} \frac{s}{\sqrt{n}}
$$

$$
\begin{aligned}
& 90 \%=(1-\alpha) 100 \% \Rightarrow 1-\alpha=0.9 \\
& \alpha=0.1 \Rightarrow \alpha / 2=0.05 \Rightarrow 1-\alpha / 2=0.95 \\
& Z_{0.95}=1.645 \\
& \text { The } 90 \% \text { CI for } \mu \text { is } \bar{x} \pm z_{1-\frac{\alpha}{2}} \frac{s}{\sqrt{n}}
\end{aligned}
$$

Which is can be written as $\left(\bar{x}-\mathrm{z}_{1-\frac{\alpha}{2}} \frac{s}{\sqrt{n}}, \bar{x}+\mathrm{z}_{1-\frac{\alpha}{2}} \frac{s}{\sqrt{n}}\right)$

$$
\begin{aligned}
& =\left(26.2-(1645) \frac{3.3}{\sqrt{123}}, 26.2+(1645) \frac{3.3}{\sqrt{123}}\right) \\
& =(25.71,26.69)
\end{aligned}
$$

Interpretation: We are $90 \%$ confident that the mean blood glucose level of diabetic ketoacidosis patient in Saudi Arabia is between 25.71 and 26.69

## Exercises

Q1: Suppose that we are interested in making some statistical inferences about the mean $\mu$ of normal population with standard deviation 0.2 . Suppose that a random sample of size $n=49$ from this population gave the sample mean4.5
The distribution of is
(a) $\mathrm{N}(0,1)$
(b) $t(48)$
(c) $\mathrm{N}\left(\mu,(0.02857)^{2}\right)$
(d) $\mathrm{N}(\mu, 2.0)$

A good point estimate for $\boldsymbol{\mu}$ is
(a) 4.5
(b) 2
(c) 2.5
(d) 7
(e) 1.125

Assumptions is
(a) Normal, $\sigma$ known
(b) Normal, $\sigma$ unknown (c)not Normal, $\sigma$ known
(d) not Normal, $\sigma$ unknown
(4)A 95\% confident interval for $\boldsymbol{\mu}$ is
(a) $(3.44,5.56)$
(b) $(3.34,5.66)$
(c) $(4.444,4.556)$
(d) $(3.94,5.05)$
(e) $(3.04,5.96)$

Q2:An electronics company wanted to estimate in monthly operating expenses riyals $(\mu)$. Assume that the population variance equals 0.584 . Suppose that a random sample of size 49 is taken and found that the sample mean equals 5.47 . Find
Point estimate for $\mu$
The distribution of the sample mean is
The assumptions ?
A $90 \%$ confident interval for $\mu$.

Q3:The random variable $X$, representing the lifespan of a certain light bulb is distributed normally with mean of 400 hours ,and standard deviation of 10 hours.
-What is the probability that a particular light bulb will last for more than 380 hours ?
-What is the probability that a particular light bulb will last for exactly 399 hours?
-What is the probability that a particular light bulb will last for between 380 and 420 hours ?
The mean is $\qquad$
The variance is.....
The standard deviation ......

Q4: The tensile of a certain type of thread is approximately normally distributed with standard deviation of 6.8 Kg . A sample of 20 pieces of the thread has an average strength of 72.8 Kg . Then

A point estimate of the population mean of tensile strength $\mu$ is
(a) 72.8
(b) 20
(c) 6.8
(d) 46.24
(e) none of these

A $98 \%$ Confident interval for mean of tensile strength $\mu$,the lower bound equal to :
(a)68.45
(b) 69.26
(c) 71.44
(d) 69.68
(e) none of these

A $98 \%$ Confident interval for mean of tensile strength $\mu$,the upper bound equal to :
(a)74.16
(b) 77.15
(c) 75.92
(d) 76.34
(e) none of these

## 5.3: Estimation of Population Proportion $\pi$

- Recall that, the population proportion
$\pi=$ no. of elementin the population with somecharachtaistic
Total no. of elementin the population

- To estimate the population proportion we take a sample of size $n$ from the population and find the sample proportion $p$

$$
p=\frac{\text { no.of element in thesample with some charachtristic }}{\text { Total no.of element in thesample }}
$$

Result: when both $n \pi>5$ and $n(1-\pi)>5$ then

$$
p \approx \mathrm{~N}(\pi, \pi(1-\pi) / n) . \quad \text { and hence } \quad \mathrm{Z}=\frac{p-\pi}{\sqrt{\pi(1-\pi) / n}} \approx \mathrm{~N}(0,1)
$$

## Estimation for $\pi$

1) Point Estimation:

A point estimator of $\pi$ ( population proportion) is p (sample proportion)

## 1) Interval Estimation: If $\underline{n p>5}$ and $\mathrm{n}(1-\mathrm{p})>5$,

The ( $1-\alpha$ ) $100 \%$ Confidence Interval for $\pi$ is given by

$$
p \pm z_{1-\frac{\alpha}{2}} \sqrt{\frac{p(1-p)}{n}}
$$

Note:1) $p \pm z_{1-\frac{\alpha}{2}} \sqrt{\frac{p(1-p)}{n}}$ can be written as

$$
\left(p-z_{1-\frac{\alpha}{2}} \sqrt{\frac{p(1-p)}{n}}, p+z_{1-\frac{\alpha}{2}} \sqrt{\frac{p(1-p)}{n}}\right)
$$

2) $n \mathrm{p}=$ the number in the sample with the characteristic
$n(1-p)=$ the number in the sample wich did not have the characteristic.

## Example 5.2

In the study on the fear (خوف) of dental care in Riyadh, $22 \%$ of 347 adults said they would hesitate (تردد) to take a dental appointment due to fear. Find the point estimate and the $95 \%$ confidence interval for proportion of adults in Riyadh who hesitate to take dental appointments.

## Solution

Variable: whether or not the person would hesitate to take a dental appointment out of fear.
Population: adults in Riyadh.
Parameter: $\pi$, the proportion who would hesitate to take an appointment.

$$
\begin{aligned}
\mathrm{n}= & 347, \mathrm{p}=22 \%=0.22, \\
& \mathrm{np}=(347)(0.22)=76.34>5 \text { and } \mathrm{n}(1-\mathrm{p})=(437)(0.78)=270.66>5
\end{aligned}
$$

1 - point estimation of $\pi$ is $\mathrm{p}=0.22$
2-95\% CI for $\pi$ is $p \pm \mathrm{z}_{1-\frac{\alpha}{2}} \sqrt{\frac{p(1-p)}{n}}$
$1-\alpha=0.95 \Rightarrow \alpha=0.05 \Rightarrow \alpha / 2=0.025 \Rightarrow 1-\alpha / 2=0.975$

$$
Z_{1-\alpha / 2}=Z_{0.975}=1.96
$$

The $95 \% \mathrm{CI}$ for $\pi$ is

$$
\begin{aligned}
& \left(p-\mathrm{z}_{1-\frac{\alpha}{2}} \sqrt{\frac{p(1-p)}{n}}, p+\mathrm{z}_{1-\frac{\alpha}{2}} \sqrt{\frac{p(1-p)}{n}}\right) \\
= & \left(0.22-(1.96) \sqrt{\frac{0.22(0.78)}{347}}, 0.22+(1.96) \sqrt{\frac{0.22(0.78)}{347}}\right) \\
= & (0.22-(1.96)(0.0222379), 0.22+(1.96)(0.0222379)) \\
& =(0.176,0.264)
\end{aligned}
$$

Interpretation: we are $95 \%$ confident that the true proportion of adult in Riyadh who hesitate to take a dental appointment is between 0.176 and 0.264 .

## Exercises

Q1: A random sample of 200 students from a certain school showed that 15 students smoke. let $\pi$ be the proportion of smokers in the school.
-Find a point estimate for $\pi$

- Find $95 \%$ confidence interval for $\pi$

Q2. A researcher was interested in making some statistical inferences about the proportion of females $(\pi)$ among the students of a certain university. A random sample of 500 students showed that 150 students are female.

1. A good point estimate formis
(A)
0.31
(B)
0.30
(C)
0.29
(D)
0.25
(E)
0.27
1.The lower limit of a $90 \%$ confidence interval for $\pi$ is
(A)
0.2363
(B)
0.2463
(C)
0.2963
(D)
0.2063
(E)
0.2663
1.The upper limit of a $90 \%$ confidence interval for $\pi$ is
(A)
0.3337
(B)
0.3137
(C)
0.3637
(D)
0.2937
(E)
0.3537

Q3. In a random sample of 500 homes in a certain city, it is found that 114 are heated by oil. Let $\pi$ be the proportion of homes in this city that are heated by oil.

1. Find a point estimate for $\pi$.
2. Construct a $98 \%$ confidence interval for $\pi$.

Q4. In a study involved 1200 car drivers, it was found that 50 car drivers do not use seat belt.

- A point estimate for the proportion of car drivers who do not use seat belt is:
(A) 50
(B) 0.0417
(C) 0.9583
(D) 1150
(E) None of these
- The lower limit of a $95 \%$ confidence interval of the proportion of car drivers not using seat belt is
(A) 0.0322
(B) 0.0416
(C) 0.0304
(D) -0.3500
(E) None of these
- The upper limit of a $95 \%$ confidence interval of the proportion of car drivers not using seat belt is
(A) 0.0417
(B) 0.0530
(C) 0.0512
(D) 0.4333
(E) None of these

Q5. A study was conducted to make some inferences about the proportion of female employees $(\pi)$ in a certain hospital. A random sample gave the following data:
-Calculate a point estimate (p) for the proportion of female employees ( $\pi$ ).
-Construct a $90 \%$ confidence interval for p .

| Sample size | 250 |
| :--- | :--- |
| Number of females | 120 |
