Abstract

Multimodal Biometric methods are one of the best convenient options, which lead to highly reliable systems in the authentication field.

Our project “Multimodal Biometric System – MBS” is based on the use of a combination of two biometrics: fingerprint and face authentication options.

In this project, we design and realize an MBS for access control purposes. The system is consisted of two main parts: hardware and software.

The hardware part includes Administrator Computer and Access Device. The software part includes main functions, system program and system database.

Our goal is, wa allhamdo LLAH, achieved: the MB System is now ready and it functions well.
