- November
- 2<sup>nd</sup>
- December

## Solution Composition

- Solute is the substance being dissolved.
- Solvent is the liquid in which the solute is dissolved.
- A solute is dissolved in a solvent.
- an aqueous solution has water as solvent.

## Aqueous Solution

- The majority of reactions occur in solutions.
- There are several ways to express the concentration of a substance in a solution based on:

➤ The volume

➤ The weight

➤ Degree of saturation

## Concentrations based on Volume

- Molarity(M)
- Normality (N)
- Activity (a)
- Weight/volume percent (w/v %)
- Volume/volume percent (v/v%)
- Milligram percent (mg %)
- Osmolarity

## Molarity

- *Molarity (M)* = the number of moles of solute per liter of solution  
= No. of moles of solute /  $V_{(L)}$
- No. of moles =  $wt_g / MW$
- It contains Avogadro's number of molecules per liter ( $6.023 \times 10^{23}$ ).
- Molar concentrations are usually given in square brackets.
- Example:  $[NaOH]$  = molarity of Sodium Hydroxide.

## Molarity Continue

➤ **Example:**

A solution of NaCl had 0.8 moles of solute in 2 liters of solution. What is its molarity?

- $M = \text{No. of moles} / V_{(L)}$
- $M = 0.8 / 2$
- $M = 0.4 \text{ molar}$

## Molarity Continue

➤ **Example:**

How many grams of solid NaOH are required to prepared 500 ml of 0.04 M solution?

- $M = \text{No. of moles} / V_{(L)}$
- $500 \text{ ml} = 500 \div 1000 = 0.5 \text{ L}$
- $\text{no. of moles} = 0.04 \times 0.5$
- $\text{no. of moles} = 0.02 \text{ mole}$
- $\text{MW of NaOH} = 23 = 16 + 1 = 40 \text{ g/ mole}$
- $\text{wt in grams} = \text{no. of moles} \times \text{MW}$
- $\text{wt in grams} = 0.02 \times 40$
- $\text{wt in grams} = 0.8 \text{ grams}$

## Normality

- *Normality (N)* = the number of equivalents of solute per liter of solution
- $$= \text{No. of equivalents} / V_{(L)}$$
- $$\text{No. of equivalents} = \text{wt}_g \text{ of solute} / \text{equivalents weight}$$
- $$\text{EW} = \text{MW of solute} / n$$
- $n$  represents the number of the replaceable hydrogen (in acids) or hydroxyl ions (in bases) per molecule.
- $n$  represents the number of electrons gained or lost per molecule (in oxidizing or reducing agents).
- $N = n * M$
- For example a 0.01 M solution of  $\text{H}_2\text{SO}_4$  is 0.02 N

## Normality Continue

➤ Example:

What is the normality of  $\text{H}_2\text{SO}_4$  solution that contains 24.5g of solute in a total volume of 100ml?

- $N = n * M$
- $n = 2$
- $M = \text{No. of moles} / V_{(L)}$
- $100 \text{ ml} = 100 \div 1000 = 0.1 \text{ L}$
- $\text{No. of moles} = \text{wt}_g / \text{MW}$
- $\text{MW of } \text{H}_2\text{SO}_4 = 2 + 32 + (16 * 4) = 98 \text{ g}$
- $\text{No. of moles} = 24.5 / 98$
- $\text{No. of moles} = 0.25 \text{ mole}$
- $M = \text{No. of moles} / V_{(L)}$
- $M = 0.25 / 0.1 = 2.5 \text{ molar}$
- $N = n * M$
- $N = 2 * 2.5 = 5 \text{ normal}$

## Normality Continue

### ➤ Example:

What is the normality of  $\text{H}_2\text{SO}_4$  solution that contains 24.5g of solute in a total volume of 100ml?

- $N = n * M$
- $n = 2$
- $M = \text{No. of moles} / V_{(L)}$
- $100 \text{ ml} = 100 \div 1000 = 0.1\text{L}$
- $\text{No. of moles} = \text{wt}_g / \text{MW}$
- $\text{MW of } \text{H}_2\text{SO}_4 = 2 + 32 + (16 * 4) = 98\text{g}$
- $\text{No. of moles} = 24.5 / 98$
- $\text{No. of moles} = 0.25 \text{ mole}$
- $M = \text{No. of moles} / V_{(L)}$
- $M = 0.25 / 0.1 = 2.5 \text{ molar}$
- $N = n * M$
- $N = 2 * 2.5 = 5 \text{ normal}$

## Osmolarity

- *Osmolarity* = the molarity of particles in a solution.
- $\text{KCl} = 2$  particals.
- $\text{CaCl}_2 = 3$  particals.
- The osmolarity of **non dissociable substance** = its molarity.
- The osmolarity of **dissociable substance** =  $n * M$
- $n$  = no. of ions produced per molecule.
- It is used when study living cells and tissues.

## Osmolarity Continue

➤ **Example:**

A solution of KCl with 0.03M, what would be its osmolarity?

- The osmolarity of **dissociable substance** =  $n * M$
- osmolarity =  $2 * 0.03$   
= 0.06 osmolar

## ISOTONIC

- ISO - means alike
- TONICITY - refers to osmotic activity of body fluids; tells the extent that fluid will allow movement of water in & out cell.
- Means that solutions on both sides of selectively permeable membrane have established equilibrium.
- Any solution put into body with the same osmolality as blood plasma.

## Osmolarity Continue

➤ **Example:**

When you want to study RBC and its osmolarity in the cytoplasm is 0.308 osmolar. What do you think the osmolarity of the invitro solution should be?

- 0.308 osmolar.

➤ **Example:**

Classify these solution in regards to the RBC osmolarity

- 1- 0.56 osmolar
- 2- 0.21 osmolar
- 3- 0.154M NaCl

## Osmolarity Continue

➤ **Example:**

When you want to study RBC and its osmolarity in the cytoplasm is 0.308 osmolar. What do you think the osmolarity of the invitro solution should be?

- 0.308 osmolar.

➤ **Example:**

Classify these solution regards the RBC osmolarity

1- 0.56 osmolar

2-0.21 osmolar

3- 0.154M NaCl

---

1= Hypertonic

2= Hypotonic

3= osmolarity = $n \cdot M = 2 \cdot 0.154 = 0.308$  osmolar so it is isotonic.

## Weight / volume percent

- Weight/volume percent (w / v %) = the weight in g of a solute per 100 ml of solution.

## Milligram percent

- Milligram percent ( mg% ) = The weight in mg of a solute per 100 ml of solution.
- Mostly used in clinical laboratories.
- **Example:**
- Blood glucose level of 200mg/dl means there is a 200mg glucose in 100ml of blood.

## Volume / volume percent

- Volume /volume percent ( v / v % ) = the volume in ml of a solute per 100 ml of solution.

## Concentrations based on Weight

- Weight/Weight percent (w/w %).
- Molality.

## Weight/weight percent

- Weight/weight percent (w/w%) = the weight in g of a solute per 100 g of solution.
- The concentration of many commercial acids are given in term of w/w %.
- In order to calculate the volume of a stock solution needed for a certain preparation, we must know the density.

$$\rho = \text{density} = \text{weight/volume}$$

- *The following equation is usually used.*

$$\text{Wt (g) of pure substance requested} = \text{volume of stock solution needed (ml)} * \rho * \% \text{ as decimal of the stock solution}$$

- The density of water is 1gm/ml.

## Weight/weight percent Continue

### ➤ Example:

Describe the preparation of 2 liters of a 0.4M HCl solution starting with a concentrated (stock) solution of HCl with 28% w/w%, the specific gravity is 1.15?

- No. of moles of pure HCl needed =  $M \cdot V$   
 $= 0.4 \cdot 2 = 0.8$  moles

MW of HCl =  $1 + 35.5 = 36.5$  g/mole

The weight in grams of pure HCl needed = no. of moles \* MW  
 $= 0.8 \cdot 36.5$   
 $= 29.2$ g

## Weight/weight percent Continue

- From the stock, 28 g of pure HCl in 100 grams solution

$$29.2 \text{g of pure HCl in ? grams solution}$$

$$= (29.2 \cdot 100) / 28$$

$$= 104.3 \text{ grams.}$$

- $\rho = \text{weight/volume}$  thus  $\text{volume} = \text{weight} / \text{density}$

- $\text{volume} = \text{weight} / \text{density}$   
 $= 104.3 / 1.15$   
 $= 90.7 \text{ ml}$

- so the volume of the stock HCl needed is 90.7ml and make up the volume to 2 liters with distilled water.

## Weight/weight percent Continue

### ➤ Example:

Describe the preparation of 2 liters of a 0.4M HCl solution starting with a concentrated (stock) solution of HCl with 28% w/w%, the specific gravity is 1.15?

- No. of moles of pure HCl needed =  $M \cdot V$   
 $= 0.4 \cdot 2 = 0.8$  moles

MW of HCl =  $1 + 35.5 = 36.5$  g/mole

The weight in grams of pure HCl needed = no. of moles \* MW  
 $= 0.8 \cdot 36.5$   
 $= 29.2$ g

## Weight/weight percent Continue

- Since Wt (g) of pure substance requested = volume of stock solution needed (ml) \*  $\rho$  \* % as decimal of the stock solution thus, volume =  $wt / (\rho \cdot \% )$
- The volume =  $29.2 / ( 1.15 \cdot 0.28)$   
 $= 90.7$  ml
- so the volume of the stock HCl needed is 90.7ml and make up the volume to 2 liters with distilled water.

## Molality

- *Molality* = the number of moles of solute per 1000 grams of solvent.
- Solution = solvent + solute.

➤ **Example:**

Calculate the molality of a concentrated HCl stock solution which has a 28% w/w%, S.G= 1.15?

- Since the weight of solution = weight of solvent + weight of solute.  
Thus, the weight of solvent = weight of solution - weight of solute.

$$= 100\text{g} - 28\text{ g}$$

$$= 72\text{g}$$

$$\text{MW of HCl} = 1 + 35.5 = 36.5 \text{ g/mole}$$

$$\text{No. of moles of solute} = 28 / 36.5$$

$$= 0.77 \text{ mole}$$

## Molality Continue

0.77 mole of solute in 72 g of solvent

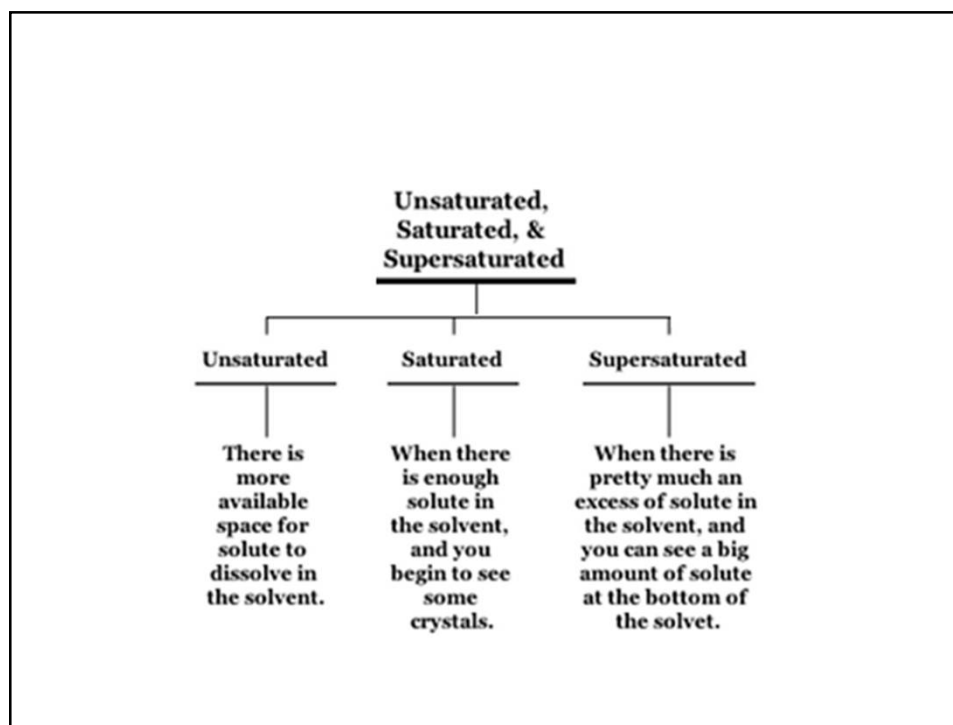

? mole of solute in 1000 g of solvent

- No. of moles of solute 1000 g of solvent =  $(0.77 * 1000) / 72$   
 $= 10.69 \text{ moles}$

- The molality is 10.69

## Saturation Degree

- **Saturated solution** is one where the concentration is at a maximum - no more solute is able to dissolve at a given temperature.
- A saturated solution represents an equilibrium: the rate of dissolving is equal to the rate of crystallization.
- **Unsaturated Solution** :less than the maximum amount of solute for that temperature is dissolved in the solvent.
- No solid remains in flask.
- **Supersaturated**
- Solvent holds more solute than is normally possible at that temperature.

## Concentrations based on Saturation Degree

- Percent saturation= the concentration of salt in solution as a percent of the maximum concentration possible at a given temperature.

$$\text{Volume (ml)} = \frac{100 (S2-S1)}{1-S2}$$

- At the equation above:
- Volume is the volume of the saturated salt needed.
- S1 is the initial low saturation ( used as a decimal).
- S2 is the final high saturation ( used as a decimal).
- This is to the volume to be added to 100 ml at saturation S1.

## Concentrations based on Saturation Degree Continue

### ➤ Example:

How many ml of a saturated ammonium sulfate solution must be added to 40ml of a 20% saturated solution to reach a final solution of 70%?

- Volume (ml) =  $(100 * (S_2 - S_1)) / (1 - S_2)$   
 $= (100 * (0.7 - 0.2)) / (1 - 0.7)$   
 $= (100 * 0.5) / (0.3)$   
 $= 50 / 0.3$   
 $= \mathbf{166.6 \text{ ml}}$
- Since 100 ml of solution need 166.6 ml saturated solution
- 40 ml of solution need ? ml
- The volume needed is  $(40 * 166.6) / 100 = 66.64 \text{ ml}$  of saturated solution needed to be added to 40 ml of 20% saturated ammonium sulfate solution to reach a final solution of 70%.

## Units Conversion

Prefix	Symbol	$10^n$
Deci	d	$10^{-1}$
Centi	c	$10^{-2}$
Milli	m	$10^{-3}$
