## Strong acid versus strong base

An acid-base titration involves a neutralization reaction in which an acid is reacted with an equivalent amount of base. The end point signals the completion of the reaction. A titration curve is constructed by plotting the pH of the solution as a function of the volume of titrant added. The titrant is always a strong acid or a strong base. The analyte may be either a strong base or acid or a weak base or acid.

In the case of a strong acid versus a strong base, both the titrant and the analyte are completely ionized.

An example is the titration of hydrochloric acid $\mathbf{H C l}$ with sodium hydroxide $\mathbf{N a O H}$ :

$$
\mathrm{H}^{+}+\mathrm{Cl}^{-}+\mathrm{Na}^{+}+\mathrm{OH}^{-} \longrightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{Na}^{+}+\mathrm{Cl}^{-}
$$

The $\mathrm{H}^{+}$and $\mathrm{OH}^{-}$combine to form $\mathrm{H}_{2} \mathrm{O}$, and the other ions ( $\mathrm{Na}^{+}$and $\mathrm{Cl}^{-}$) remain unchanged, so the net result of neutralization is conversion of the HCl to a neutral solution of NaCl .

## Titration of

## 100 mL of 0.1 MHCl with 0.1 M NaOH

## $\mathrm{HCl}+\mathrm{NaOH} \longrightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{NaCl}$

100 mL 0.1 M HCl vs. $\mathbf{0 . 1} \mathrm{M} \mathrm{NaOH}$

The titration curve for 100 mL of 0.1 MHCl titrated with 0.1 M NaOH

|  | A | B | C | D | E |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 100.00 mL of 0.1000 M HCl vs. 0.1000 M NaOH |  |  |  |  |
| 2 | $\mathrm{mL}_{\mathrm{HCl}}=$ | 100.00 | $\mathrm{M}_{\mathrm{HCl}}=$ | 0.1000 |  |
| 3 | $\mathrm{M}_{\mathrm{NaOH}}=$ | 0.1000 | $\mathrm{K}_{\mathrm{w}}=$ | $1.00 \mathrm{E}-14$ |  |
| 4 | $\mathrm{mL}_{\mathrm{NaOH}}$ | [ $\mathrm{H}^{+}$] | [ $\mathrm{OH}^{-}$] | pOH | pH |

Equations governing a strong-acid $(\mathrm{HX})$ or strong-base $(\mathrm{BOH})$ titration

| Fraction $f$ <br> Titrated | Strong Acid |  | Strong Base |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Present | Equation | Present | Equation |
| $f=0$ | HX | $\left[\mathrm{H}^{+}\right]=[\mathrm{HX}]$ | BOH | $\left[\mathrm{OH}^{-}\right]=[\mathrm{BOH}]$ |
| $0<f<1$ | HX/X ${ }^{-}$ | $\left[\mathrm{H}^{+}\right]=$[remaining HX] | BOH/B ${ }^{+}$ | $\left[\mathrm{OH}^{-}\right]=$[remaining BOH$]$ |
| $f=1$ | $\mathrm{X}^{-}$ | $\left[\mathrm{H}^{+}\right]=\sqrt{K_{w}}$ | $\mathrm{B}^{+}$ | $\left[\mathrm{H}^{+}\right]=\sqrt{K_{w}}$ |
| $f>1$ | $\mathrm{OH}^{-} / \mathrm{X}^{-}$ | $\left[\mathrm{OH}^{-}\right]=$[excess titrant] | $\mathrm{H}^{+} / \mathrm{B}^{+}$ | $\left[\mathrm{H}^{+}\right]=$[excess titrant] |

$f$ to denote the fraction of analyte

Note that prior to the equivalence point, when there is excess acid, the relationship is
$\left[\mathrm{H}^{+}\right]=\left(M_{\text {acid }} \times \mathrm{V}_{\text {acid }}-M_{\text {base }} \times \mathrm{V}_{\text {base }}\right) / \mathrm{V}_{\text {total }}$
Beyond the equivalence point when there is excess base,
$\left[\mathrm{OH}^{-}\right]=\left(M_{\text {base }} \times \mathrm{V}_{\text {base }}-M_{\text {acid }} \times \mathrm{V}_{\text {acid }}\right) / \mathrm{V}_{\text {total }}$
Where: V is the volume and $\mathrm{V}_{\text {total }}$ is always $\mathrm{V}_{\text {acid }}+\mathrm{V}_{\text {base }}$

Titration curve for 100 mL 0.1 M NaOH vs. 0.1 MHCl .

The equivalence point pH is 7.00 .

Dependence of the magnitude of end-point break on concentration.
-Curve 1: 100 mL of 0.1 MHCl vs. 0.1 MNaOH .
-Curve 2: 100 mL of 0.01 MHCl vs. 0.01 MNaOH .
-Curve 3: 100 mL of 0.001 MHCl vs. 0.0001 MNaOH . The equivalence point pH is 7.00 in all cases.

## Example

Calculate the pH at $0,10,90,100$ and $110 \%$ titration (\% of the equivalence point volume) for the titration of 50.0 mL of 0.100 MHCl with 0.100 M NaOH .

## Solution

At 0\%:
$\mathrm{pH}=-\log 0.100=1.00$
At 10\%:
5.0 mL NaOH is added. We start with $0.100 \mathrm{M} \times 50.0 \mathrm{~mL}=5.00 \mathrm{mmol} \mathrm{H}$. Calculate the concentration of $\mathrm{H}^{+}$after adding the NaOH :
$\mathrm{mmol} \mathrm{H}+$ at start $=5.00 \mathrm{mmol} \mathrm{H}^{+}$
mmol OH - added $=0.100 \mathrm{M} \times 5.0 \mathrm{~mL}=0.500 \mathrm{mmol} \mathrm{OH}^{-}$
$\mathrm{mmol} \mathrm{H}+$ left $=4.50 \mathrm{mmol} \mathrm{H}^{+}$in 55.0 mL
$\left[\mathrm{H}^{+}\right]=4.50 \mathrm{mmol} / 55.0 \mathrm{~mL}=0.0818 \mathrm{MpH}=-\log 0.0818=1.09$
At 90\%:
$\mathrm{mmol} \mathrm{H}+$ at start $=5.00 \mathrm{mmol} \mathrm{H}^{+}$
mmol OH - added $=0.100 \mathrm{M} \times 45.0 \mathrm{~mL}=4.50 \mathrm{mmol} \mathrm{OH}^{-}$
$\mathrm{mmol} \mathrm{H}+$ left $=0.50 \mathrm{mmol} \mathrm{H}+$ in 95.0 mL
$\left[\mathrm{H}^{+}\right]=0.00526 \mathrm{MpH}=-\log 0.00526=2.28$
At 100\%:
All the $\mathrm{H}^{+}$has been reacted with $\mathrm{OH}^{-}$, and we have a 0.050 M solution of NaCl . Therefore, the pH is 7.00 .

## At 110\%:

We now have a solution consisting of NaCl and excess added NaOH .
$\mathrm{mmol} \mathrm{OH}=0.100 \mathrm{M} \times 5.00 \mathrm{~mL}=0.50 \mathrm{mmol} \mathrm{OH}^{-}$in 105 mL
$\left[\mathrm{OH}^{-}\right]=0.00476 \mathrm{M}$
$\mathrm{pOH}=-\log 0.00476=2.32 ; \mathrm{pH}=11.68$

Thymolphthalein－———————————————————— colorless $\square$ blue

## Weak acid versus strong base

Example, the titration of 100 mL of 0.1 M acetic acid (as a weak acid) with 0.1 M sodium hydroxide (as a strong base). The neutralization reaction is:

$$
\mathrm{HOAc}+\mathrm{Na}^{+}+\mathrm{OH}^{-} \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{Na}^{+}+\mathrm{OAc}^{-}
$$

Equations governing a weak-acid (HA) titration

| Fraction $f$ <br> Titrated | Present | Weak Acid |
| :--- | :--- | :--- |
| $f=0$ | HA | $\left[\mathrm{H}^{+}\right]=\sqrt{K_{a} \cdot C_{\mathrm{HA}}}$ |
| $0<f<1$ | $\mathrm{HA} / \mathrm{A}^{-}$ | $\mathrm{pH}=\mathrm{p} K_{a}+\log \frac{C_{\mathrm{A}^{-}}}{C_{\mathrm{HA}}}$ |
| $f=1$ | $\mathrm{~A}^{-}$ | $\left[\mathrm{OH}^{-}\right]=\sqrt{\frac{K_{w}}{K_{a}} \cdot C_{\mathrm{A}^{-}}}$ |
| $f>1$ | $\mathrm{OH}^{-} / \mathrm{A}^{-}$ | $\left[\mathrm{OH}^{-}\right]=[$excess titrant $]$ |

## Weak base versus strong acid

The titration of a weak base with a strong acid is completely analogous to the above case, but the titration curves are the reverse of those for a weak acid versus a strong base. Example, the titration of 100 mL of 0.1 M ammonia (as a weak base) with 0.1 M hydrochloric acid (as a strong acid). The neutralization reaction is:

$$
\mathrm{NH}_{3}+\mathrm{H}^{+}+\mathrm{Cl}^{-} \rightarrow \mathrm{NH}_{4}^{+}+\mathrm{Cl}^{-}
$$

Equations governing a weak-base (B) titration

| Fraction $f$ <br> Titrated | Weak Base |  |
| :--- | :--- | :--- |
|  | Present | Equation |
| $f=0$ | B | $\left[\mathrm{OH}^{-}\right]=\sqrt{K_{b} \cdot C_{\mathrm{B}}}$ |
| $0<f<1$ | $\mathrm{~B} / \mathrm{BH}^{+}$ | $\mathrm{pH}=\left(\mathrm{p} K_{w}-\mathrm{p} K_{b}\right)+\log \frac{C_{\mathrm{B}}}{C_{\mathrm{BH}^{+}}}$ |
| $f=1$ | $\mathrm{BH}^{+}$ | $\left[\mathrm{H}^{+}\right]=\sqrt{\frac{K_{w}}{K_{b}} \cdot C_{\mathrm{BH}^{+}}}$ |
| $f>1$ | $\mathrm{H}^{+} / \mathrm{BH}^{+}$ | $\left[\mathrm{H}^{+}\right]=$[excess titrant $]$ |

Titration curve for $100 \mathrm{~mL} 0.1 \mathrm{M} \mathrm{NH}_{3}$ versus 0.1 MHCl .

Titration curves for 100 mL 0.1 M weak acids of different $K_{a}$ values versus 0.1 M NaOH .

## Example

Calculate the pH at $0,10.0,25.0,50.0$, and 60.0 mL titrant in the titration of 50.0 mL of 0.100 M acetic acid with 0.100 MNaOH .

## Solution

At 0 mL
We have a solution of only 0.100 MHOAc :

$$
\begin{aligned}
\frac{(x)(x)}{0.100-x} & =1.75 \times 10^{-5} \\
{\left[\mathrm{H}^{+}\right] } & =x=1.32 \times 10^{-3} M \\
\mathrm{pH} & =2.88
\end{aligned}
$$

At 10.0 mL
We started with $0.100 \mathrm{M} \times 50.0 \mathrm{~mL}=5.00 \mathrm{mmol} \mathrm{HOAc}$; part has reacted with $\mathrm{OH}^{-}$ and has been converted to $\mathrm{OAc}^{-}$:
mmol HOAc at start $=5.00 \mathrm{mmol} \mathrm{HOAc}$
$\mathrm{mmol} \mathrm{OH}+$ added $=0.100 \mathrm{M} \times 10.0 \mathrm{~mL}=1.00 \mathrm{mmol} \mathrm{OH}^{-}$
$=\mathrm{mmol} \mathrm{OAc}{ }^{-}$formed in 60.0 mL
mmol HOAc left $=4.00 \mathrm{mmol} \mathrm{HOAc}$ in 60.0 mL
We have a buffer. Since volumes cancel, use millimoles:

$$
\begin{aligned}
& \mathrm{pH}=\mathrm{p} K_{a}+\log \frac{\left[\mathrm{OAc}^{-}\right]}{[\mathrm{HOAc}]} \\
& \mathrm{pH}=4.76+\log \frac{1.00}{4.00}=4.16
\end{aligned}
$$

## At 25.0 mL

One-half the HOAc has been converted to $\mathrm{OAc}^{-}$, so $\mathrm{pH}=\mathrm{pKa}$ :
mmol HOAc at start $=5.00 \mathrm{mmol} \mathrm{HOAc}$
$\mathrm{mmol} \mathrm{OH}^{-}=0.100 \mathrm{M} \times 25.0 \mathrm{~mL}=2.50 \mathrm{mmol}_{\mathrm{OAc}}{ }^{-}$formed
mmol HOAc left $=2.50 \mathrm{mmol} \mathrm{HOAc}$

$$
\mathrm{pH}=4.76+\log \frac{2.50}{2.50}=4.76
$$

## At 50.0 mL

All the HOAc has been converted to $\mathrm{OAc}^{-}(5.00 \mathrm{mmol}$ in 100 mL , or 0.0500 M ):

$$
\begin{aligned}
{\left[\mathrm{OH}^{-}\right] } & =\sqrt{\frac{K_{w}}{K_{a}}\left[\mathrm{OAc}^{-}\right]} \\
& =\sqrt{\frac{1.0 \times 10^{-14}}{1.75 \times 10^{-5}} \times 0.0500}=5.35 \times 10^{-6} \mathrm{M} \\
\mathrm{pOH} & =5.27 \quad \mathrm{pH}=8.73
\end{aligned}
$$

At 60.0 mL
We have a solution of NaOAc and excess added NaOH . The hydrolysis of the acetate is negligible in the presence of added $\mathrm{OH}^{-}$. So the pH is determined by the concentration of excess $\mathrm{OH}^{-}$:
$\mathrm{mmol} \mathrm{OH}^{-}=0.100 \mathrm{M} \times 10.0 \mathrm{~mL}=1.00 \mathrm{mmol}$ in 110 mL
$\left[\mathrm{OH}^{-}\right]=0.00909 \mathrm{M}$
$\mathrm{pOH}=-2.04 ; \mathrm{pH}=11.96$
$412$
