Question No.	Q_1	Q_2	Q_3	Q_4	Total
Maximum Marks					

Question I

i. Solve the equation by completing the square: $2x^2 + 6x - \frac{7}{2} = 0$ (all details are needed)

ii. Two resistors when connected in series have a total resistance of 40Ω when connected in parallel their total resistance is 8.4Ω . If one of the resistors has a resistance of $R_x \Omega$. (write all details)

a. Show that $R_x^2 - 40R_x + 336 = 0$

b. Calculate the resistance of each.

Question 2

- i. In figure below the moment of weight W is 5. The lever balances when $d_1 = 3\text{m}$ and $d_2 = 2\text{m}$ and when $d_1 = 6\text{m}$ and $d_2 = 3\text{m}$. Determine the weights W_1 and W_2 (write all details)

- ii. Resolve $\frac{3 + 6x + 4x^2 - 2x^3}{x^2(x^2 + 3)}$ into partial fractions (all details are needed)

Question 3

- i. Find the currents of the circuits by solving the system of equations given (write all details)

$$I_1 - I_2 + I_3 = 0$$

$$I_1 + 2I_2 = 10$$

$$-2I_1 - I_3 = -5$$

- ii. Simplify the complex fraction $\frac{\frac{2}{x-2} + \frac{1}{x}}{3x-2}$ (all details are needed)

Question 4

- i. Solve the following systems of equations by using Cramer rule (all details are needed)

$$2x - 3y + z = 1$$

$$x - 2y - 3z = 1$$

$$2x - z = 2$$

- ii. Solve the given equation for x : $\frac{1}{x} - \frac{1}{x-4} = \frac{1}{3}$ (all details are needed)
