68 – 90	93	23	15000	80000	12	43	21000	65000	
Total	1732	1311			1984	1429			

Answer the following questions:

1. How to simulate the gender type of the client from the table? Write the algorithm.

-		_
$\bar{\chi}(x) =$	E Idd	F(x;)

Edd F(x;) Sum of uniform dist-[x(x) = Frat Famore parameter gransform

2 claim a= min claim

2. Give a simulated gender type of the 4 clients using the following uniform values:

arve a simia	latea genaci	type of the	chemes dame	CHIC TOTTO WATER
u~U[0,1]	0.1466	0.7061	0.8585	0.4944
				1 -

3. Given that you want to simulate the age of a male client between 28 and 38, what you will do assuming uniform distribution? f(x)= b-a+1 F(u)= u(b-a+1)+a = u(38-28+1)+28

F(x) = x-a = u ~ F(u) = u(b-a) +a

- 4. How to simulate the exact age of the client from the table assuming uniform distribution? Write the algorithm.

exact age of the client from the table assuming unit
$$F(u) = u + b - a + b + c$$

$$age$$

5. Give a simulated exact age (round to 1 decimal digit ##.#) for 4 clients using the following uniform values assuming uniform distribution in each category:

u~U[0,1]	0.5915	0.1998	0.9780	0.6281
	23,9			
		-		

6. How to generate the amount of the claim for each client from the table assuming integer uniform? Write the general algorithm.

7. Give a simulated exact amount of the claim for 4 clients using the following uniform values assuming discrete uniform distribution in each category:

u~U[0,1]	0.3887	0.0739	0.9482	0.7715	
	3742.64		() ~		
			,		

OR 441 - Final Exam

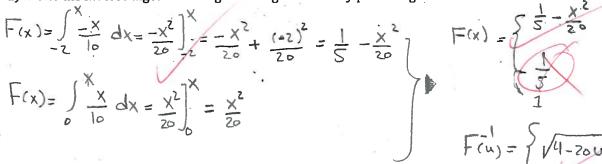

Question #2:

Consider an investment with a monthly return on investment. The monthly percentage of return on investment is a random variable X% given by the following probability function:

$$f(x) = \begin{cases} \frac{|x|}{10}, & -2 \le x \le 4 \\ 0, & \text{otherwise.} \end{cases} \quad \text{where} \qquad f(x) = \begin{cases} \frac{-x}{10} & ; -2 \le x \le 0 \\ \frac{x}{10} & ; 0 \le x \le 4 \end{cases}$$

Answer the following:

1) Write the inverse algorithm for generating the monthly percentage of return on investment.

2) Using simulation and the following U[0,1] numbers, evaluate the results of the investment for 6 months with initial budget of 100,000 SR.

Mon.	u	X(n)	ATCN)		
1	0.032	/ 1. 833	1.833		
2	0.138	1-11355	2.94655	> Stop	here
3	0.623	3.52.98	6.47	20	
4	0.691	3.717/			
5	0.006	0.346		9	
6			a	e e	

3) From simulation, compute the average and standard deviation of the monthly percentage of return on investment. $Average = \int x f(x)$

- 4) From simulation compute the probability that the company will have profit more than 10000 SR per month. $P(x > |x_0| > 0) =$
- 5) From simulation output, what is the probability of losing.

Puttion Arrive ~ Poisson (8) health Cond. (Serius, stable) Conticul

OR 441 - Final Exam

Question #3:

Patients arrive to a hospital's emergency room according to a Poisson process with rate 8 patients per hour. Patients come in three different health conditions. The patients are categorized according to their condition as critical, serious, or stable. In the past year, statistics show that:

10% of the emergency room patients were critical: and take random amount of treatment of Erlang with parameters $\alpha = 2$ and $\lambda = 0.5$ per hour

ii. 30% of the emergency room patients were serious; and take random amount of treatment of

Exponential with average time of 2 hours.

iii. the rest of the emergency room patients were stable; and take random amount of treatment of integer uniform between 15 min and 30 min.

After treatment at the ER, statistics show that: 40% of the critical patients died; 10% of the serious patients died; and 1% of the stable patients died.

Answer the following with *True* or *False*:

a very superior		Tenti) TentaTent) = PATO
F	1.	To simulate the ER system, we have to simulate 3 independent random processes only: Patients Arrival Time PAT(n), Patient Treatment Time PTT(n) and Patient Exit Conditions PEC(n). + Patient Come Condition
T	2.	To simulate the patient's arrival to ER system, we need to use the inverse transform for exponential distribution with mean value = $1/8$.
T	3.	The time between arrivals T(n) is simulated by the function: $-8 \ln(1-u)$ where $u \sim U[0,1]$
F	4.	The arrival time of the patient (n) = PAT(n) is equal to PAT(n-1) - T(n). Where T(n) time between arrivals from simulation. $\Rightarrow = PAT(n-1) + T(n)$
27	5.	The condition of the patient CP(n) can be generated as a random process with discrete uniform with values 1, 2, 3.
T	6.	To simulate the condition of the patient CP(n), get $u_1 \sim U[0,1]$: if $0 \le u_1 \le 0.1$ then CP(n)=1 (<i>Critical</i>). If $0.1 < u \le 0.3$ then CP(n)=2 (<i>serious</i>). If $0.3 < u \le 1$ then CP(n)=3 (<i>stable</i>)
W	7.	Patient Treatment Time $PTT(n)$ is a random variable depends on the condition of the patient $CP(n)$.
F	8.	If the condition of the patient $CP(n)=2$ (serious) then $PTT(n)\sim DU$ (15, 30 min); using discrete inverse method: take $u_2 \sim U[0,1]$ and $PTT(n)=15+int[(1+30-15)u_2]$
F	9.	If the condition of the patient $CP(n) = 1$ (critical) then we generate the Patient Treatment Time $PTT(n) \sim Er(\alpha = 2 \text{ and } \lambda = 0.5 \text{ per hour})$ by using inverse transform method directly.
T	10.	It is always possible to use acceptance/rejection method to generate the Patient Treatment Time PTT(n) \sim Er(α = 2 and λ = 0.5 per hour).
T	11.	Patient Exit Conditions $PEC(n)$ is also a random variable depends on the condition of the patient $CP(n)$.
T	12.	If condition of the patient $CP(n) = 2$ (serious), then Patient Exit Conditions $PEC(n) \sim$ Bernoulli $(p = 0.1)$ with $w \sim U[0,1]$ If $w < 0.1$ then $PEC(n) = Lived$, Else $PEC(n) = Died$
F	13.	If condition of the patient CP(n) = 3 (stable), then Patient Exit Conditions PEC(n) \sim Bernoulli (p = 0.01) with $w \sim U[0,1]$ If $w < 0.99$ then PEC(n) = <i>Lived</i> , Else PEC(n) = <i>Died</i>
T	14.	The patient Departure time $DT(n)$ is equal to patient arrival time $PAT(n) + Patient$ Treatment Time $PTT(n)$.

Question #4:

An insurance policy pays for the insured 1000 SR per day spent admitted in a hospital for up to three days. If the insured spend more than three days, the insurance company pays 500 SR per day for each extra day of hospitalization thereafter. The number of days that an insured customer spends in the hospital, X, is a discrete random variable with probability function:

$$P[X = k] = \begin{cases} \frac{6-k}{15}, & k = 1, 2, 3, 4, 5\\ 0, & \text{otherwise.} \end{cases}$$

Answer the following:

1) Write the inverse algorithm for generating number of days for the insured clients

2) Write the simulation algorithm and use the following U[0,1] numbers, give the results for the 9 hsured clients.

u	Days	Cost (n)	u	Days	Cost (n)	u	Days	Cost (n)
0.032	1	1000	0.691	3	3000	0.823	4	3500
0.138	1	/000/	0.006	1	1000	0.776	3	3000
0.623	3	3000	0.413	2	2000	0.306	1	\000

3) Compute the average and standard deviation of amount that the insurance company will pay per claim.

4) Compute the average and standard deviation of number of days that a client spends in the hospital. Standard

5) Fro	m simulati	on compute th	e probability	that the company	will pay more tha	n 2000 SR. 🔌 🖰	Vations /Var(s)

Question #5: Consider the following are functions in EXCEL.

		_	<u>.</u>			
A	RANDBETWEEN(a,b)	E	GAMMA.DIST(a,b,c,d)	J	RAND()	
B	NORM.DIST(a,b,c,d)	F	DATA TABLE	V	BINOM.INV(a,b,c)	
С	GAMMA.INV(a,b,c,d)	Æ	BINOM.DIST(a,b,c)	K	CONFIDENCE.T(a,b,c)	
D	VLOOKUP(a,b,c)	H	NORM.INV(a,b,c)		300	

Read each statement and assign the letter of EXCEL function from the table to the statement.

	The Statement	Excel Function					
1.	Used to compute the PDF function of the Normal distribution with $\mu=a$ and $\sigma=b$ at the value a						
2.	sed to generates random values from relative frequency table.						
3.	Ised generate integer random values with equal distributions between (a) and (b) including the (a) and (b)						
4.	Used to generate random values from Exponential distribution	C					
5.	Used to compute the upper limit of the confidence interval from sample	К					
6.	Used generate integer random values with equal distributions between (a) and (b) without the (a) and (b)	A					
7.	Used to generate random values from Erlang distribution	<u></u>					
8.	Used to compute the PDF function of the Gamma distribution at the value a	E					
9.	Used to compute the CDF function of the Normal distribution with μ = a and σ = b at the a						
10.	Used to Generates random values from Gamma distribution	C					
11.	Used to generate random values from of integer values (a) to (b) with different probabilities	A/I					
12.	Used to compute the CDF function of the Gamma distribution at the value a	E					
13.	Used to generate continuous random values between a and b with uniform distribution	I					
14.	Used to compute the PMF function of the Binomial distribution with value a	·G					
15.	Used to run the simulation model for many times and record the measures from every run	D					
16.	Used to compute the CDF function of the Binomial distribution with at the value a	G					
17.	Used to compute the CDF function of the Exponential distribution at the value a	E					
18.	Used to generate random values from standard deviation	Н					
19.	Used to compute the CDF function of the Erlang distribution at the value a	E					
20.	Used to Generates random values from normal distribution with mean \boldsymbol{b} and standard deviation \boldsymbol{c}	Н					
21.	Used to generate continuous random values between 0 and 1 with uniform distribution	I					
22.	Used to compute $Z_{\alpha/2}$ ϑ	FX					
23.	Used to compute the lower limit of the confidence interval from sample	К					
24.	Used to generate random values from binomial distribution	2					

OR 441 - Final Exam

Question #6:

Customer arrive to a car repair station for maintenance according to a random process with time between arrivals (in hours) follows Erlang distribution with parameters r=2 and λ = 0.5. The arriving cars come to a single repairman to perform the maintenance. It is assumed that the repair time (in hours) follows a random time that follows a Weibull distribution with parameters $\alpha = 2$ and $\beta = 3$. The cars are repaired according to the order of their arrival. The repair station has a space that can hold any number of cars. The following data was collected.

1.) Define all the variables and random process and the logic of the system TRC(n), AT(n) 2. Draw the flow chart for the system for simulation of 10 cars. ST(n), WT(n), IT(n)

3. Complete the results of simulation in the table below? Use uniform values as needed starting from u_1

car#	time btwn cars	Arrival Time	Service time	start time	Wait? (0/1)	Waiting Time	Exit tlme	Idle Time
