- Timeline History
- Milestone Electrospinning
- Types of Electrospinning; Examples
History of Electrospinning - Timeline
The first known experiments on electrospinning are based on previous experiments with liquids in electrical fields.
William Gilbert (1500s)
(24 May 1544 – 30 November 1603), was an English physician, physicist and natural philosopher.

In the late 1500s Sir. William Gilbert set out to describe the behavior of magnetic and electrostatic phenomena.
He observed that when a suitably electrically charged piece of amber was brought near a droplet of water it would form a cone shape and small droplets would be ejected from the tip of the cone: this is the first recorded observation of electrospraying.
In 1902 and 1903, Cooley and Moore described in patents, apparatus for spraying of liquids by use of electrical charges.

The amount of charge required for the deformation of droplets was described by Lord Raleigh.

J.F. Cooley (1902) and W.J. Morton (1903)

In 1902 and 1903, Cooley and Moore described in patents, apparatus for spraying of liquids by use of electrical charges.
John Zeleny (1914)
(1872–1951) was a Czech-American physicist at the University of Minnesota, who in 1911 invented the Zeleny electroscope.

- Zeleny published work on the behavior of fluid droplets at the end of metal capillaries.

- His effort began the attempt to mathematically model the behavior of fluids under electrostatic forces.

- Zeleny reported that the fine fiber-like liquid jets could be emitted from a charged liquid droplet in the presence of an electrical potential, which is considered to be the origin of principle for the modern needle Electrospinning.

Hagiwaba (1929)

- Preparation of artificial silk by electrical charges.
Anton Formhals (1934-1944)

In 1934, a crucial patent, revealing the experimental apparatus for the practical production of artificial filaments using electrical field was issued for the first time by Formhals.

Fabrication of textile yarns and a voltage of 57 kilovolt (kV) was used for electrospinning cellulose acetate using acetone and monomethyl ether of ethylene glycol as solvent.
Later on, a series of patents were issued, which focused on improvements and modifications on the electrospinning apparatus.
 **C.L Norton** (1936)
  ❖ **Electrospinning from a melt** rather than a solution using an air-blast to assist fibre formation.

 **N.D. Rozenblum and I.V. Petryanov-Sokolov** (1938)
  ❖ They working in Prof. N.A. Fuks’s group at the Aerosol Laboratory of the L. Ya Karpov Institute in the USSR, generated electrospun fibres
  ❖ They developed into filter materials known as "Petryanov filters".
  ❖ **By 1939**, this work had led to the establishment of a factory in “Tver' for the manufacture of electrospun smoke filter elements for gas masks.
  ❖ The material, dubbed BF (Battlefield Filter) was spun from cellulose acetate in a solvent mixture of dichloroethane and ethanol.
  ❖ **By the 1960s** output of spun filtration material was claimed as 20 million m² per annum.
Geoffrey Ingram Taylor (1960s)

Geoffrey Ingram Taylor (7 March 1886 – 27 June 1975) was a British physicist and mathematician.

- **Taylor** produced the theoretical underpinning of electrospinning.
- **Taylor’s work contributed to electrospinning by mathematically modelling the shape of the cone formed by the fluid droplet under the effect of an electric field.
- This characteristic droplet shape is now known as the **Taylor cone**.
A Taylor cone refers to the cone observed in electrospinning, electrospraying and hydrodynamic spray processes from which a jet of charged particles emanates above a threshold voltage.

This cone was described by Taylor in 1964 before electrospray was "discovered".

When a small volume of electrically conductive liquid is exposed to an electric field, the shape of liquid starts to deform from the shape caused by surface tension alone.
1971

- Baumgarten reported on electrospinning of acrylic microfibers.
- Larrondo and Manley reported in a series of papers on electrospinning of polymer melts.

1970s

- Some attempts at commercialization were undertaken.
- For example: Simm, from the Bayer company, submitted a series of patents on electrospinning of plastics.

- A variety of electrospinning setups were suggested in early electrospinning setups that have some similarities to recent efforts.
Industry vs. Academia

- The first technical application for electrospinning was suggested for the nonwoven industry.
- Academia picked-up electrospinning slowly in the 1990s.

- Some companies such as espin Technologies, Nano Technics, and KATO Tech are constantly benefited by the utmost features derived from electrospinning.
- While companies such as Donaldson Company and Freudenberg have already applied the outcome of electrospinning process in their air filtration products since past two decades.
1990s

- Academia picked-up electrospinning slowly in the 1990s.
- Several research groups, especially the Reneker’s group (The University of Akron), revived electrospinning by demonstrating the fabrication of ultra-thin fibers from various polymers.
Growing Popularity of Electrospinning (1994-2013)

Application of Nanofibers
Since 1995 there have been further theoretical developments of the driving mechanisms of the electrospinning process.

1995

- Reznik et al. describes extensive work on the shape of the Taylor cone and the subsequent ejection of a fluid jet.

2001

- Hohman et al. investigates the relative growth rates of the numerous proposed instabilities in an electrically forced jet once in flight.

- Yarin et al. endeavoring to describe the most important instability to the electrospinning process, the bending (whipping) instability.

Reznik (2004)

- Reznik et al. describes extensive work on the shape of the Taylor cone and the subsequent ejection of a fluid jet.
Milestone in Electrospinning
Milestone in Electrospinning

- Solution electrospinning
- Emulsion electrospinning
  - Growth factor released nanofibrous scaffolds
  - Guiding effect of aligned electrospun nanofibers on human cells
  - Drug eluting nanofibers
- Core-shell electrospinning
  - Drug delivery and Ceramic nanofibers
  - Scaffolds for tissue engineering
  - Aligned nanofibers
  - Theoretical model for electrospinning Jet formation
  - Electrospinning nanocomposites
- Melt electrospinning
- Biomimetic extracellular matrix nanofibrous scaffolds
Types of Electrospinning; Examples
Electrospinning Process
Coaxial Electrospinning
Emulsion Electrospinning
Nozzle-Less Electrospinning Unit

The nozzle-less principle using rotating electrodes has been developed into a commercially available industrial scale.
Electrospun Architectures
At KSU: Nanofibers Facilities (Electrospinning Setup)
Electrospinning is an Old
But
Yet Fascinating Technique
