Solutions of Exercises Sheet #5

SOLUTION 1:

a)

$$F(x) = \int_0^x \frac{2}{\beta^2} x e^{\left(-\left(x/\beta\right)^2\right)} dx$$

$$u = -\left(x/\beta \right)^2, \; du = \frac{-2}{\beta^2} x \, dx$$

$$F(u) = -\int e^u \, du = -e^u \Rightarrow F(x) = -e^{-x^2/\beta^2} \Big|_0^x = -e^{-x^2/\beta^2} + 1$$

The inverse of the CDF is:

$$F(x) = -e^{-x^2/\beta^2} + 1$$

$$U = -e^{-x^2/\beta^2} + 1$$

$$\ln(1-U) = \frac{-x^2}{\beta^2} \Rightarrow -x^2 = \beta^2 \ln(1-U) \Rightarrow x = \sqrt{-\beta^2 \ln(1-U)}$$

b)

Using the inverse CDF from above, with β = 2.0, and the uniform numbers given it is yields:

u =	0.943	0.398	0.372	0.943	0.204	0.794
$F^{-1}(u)$ =	3.385087302	1.424777644	1.36413359	3.385087302	0.955313756	2.513864841

	A	B	C	D	E	F	G
1	beta =	2					
2	u =	0.0509933	0.40752994	0.0652326	0.33930042	0.48971631	0.18430718
3	Finv(u) =	0.45755619	1.44700372	0.51945184	1.2875652	1.64047365	0.90270136

	A	B	C	D
1	beta =	2		
2	u =	=RAND()	=RAND()	=RAND()
3	Finv(u) =	=SQRT(-1*(B1^2)*LN(1-B2))	=SQRT(-1*(B1^2)*LN(1-C2))	=SQRT(-1*(B1^2)*LN(1-D2))

SOLUTION 2:

a)

Negative Binomial = Σ *iid* Geometric variables

Geometric

Definition of k	k: the number of trials until get the first success	k: the number of failures before the first success
Parameters	$0 < p < 1$ success probability (real)	$0 < p \leq 1$ success probability (real)
Support	k trials where $k \in \{1, 2, 3, \dots\}$	k failures where $k \in \{0, 1, 2, 3, \dots\}$
Probability mass function (pmf)	$(1-p)^{k-1}\,p$	$(1-p)^k\,p$
CDF	$1-(1-p)^k$	$1-(1-p)^{k+1}$
Mean	$\frac{1}{p}$	$\frac{1-p}{p}$
Variance	$\frac{1-p}{p^2}$	$\frac{1-p}{p^2}$
Inverse cdf	k=floor(ln(1-u)/ln(1-p)) , $0 < u < 1$	k=floor(ln(1-u)/ln(1-p))-1 , $0 < u < 1$

Negative Binomial

Definition of k	x: the number of trials until get the r successes	x: the number of failures before the r successes
pmf	$\binom{x-1}{r-1} p^r (1-p)^{x-r}$, $x = r, r+1, r+2, \dots$	$\binom{x+r-1}{x} p^r (1-p)^x$ $Range(X) = \{0, 1, 2, 3, \dots\}$
mean	$E(X) = \frac{r}{p}$	$\frac{r(1-p)}{p}$
variance	$Var(X) = \frac{r(1-p)}{p^2}$	$\frac{r(1-p)}{p^2}$

Convolution method: The negative binomial distribution ($r = 4$, $p = 0.4$) is the sum of 4 geometric random variables with ($p = 0.4$).

U	GEOM(p=0.4) = floor(ln(1-u)/ln(1-p))
0.943	5
0.498	1
0.102	0
0.398	0

Answer: 6 trials

	A	B	C
1	p =	0.4	
2	1	5	
3	2	1	
4	3	6	
5	4	1	
6	Sum =	13	
7			
8		13

12	4	11	
13	5	12	

	A	B
1	p =	0.4
2	1	= INT(LN(1-RAND())/LN(1-B1))
3	2	= INT(LN(1-RAND())/LN(1-B1))
4	3	= INT(LN(1-RAND())/LN(1-B1))
5	4	= INT(LN(1-RAND())/LN(1-B1))
6	Sum =	=SUM(B2:B5)
7		
8		=B6
9	1	=TABLE(,A8)
10	2	=TABLE(,A8)
11	3	=TABLE(,A8)
12	4	=TABLE(,A8)
13	5	=TABLE(,A8)

b)

Bernoulli (*p*)

X ~ Bernoulli(*p*)

$\Pr\{X=1\} = p$ and $\Pr\{X=0\} = 1-p$

For u~ U[0,1]

$$F(u)^{-1} = \begin{cases} 1 & ;\ 0 \le u \le p \\ 0 & ;\ p < u \le 1 \end{cases}$$

Bernoulli trials: Generate Bernoulli trials ($p = 0.4$)until you get 4 successes

	U	Bernoulli trial
1	0.943	0
2	0.498	0
3	0.102	1
4	0.398	1
5	0.528	0
6	0.057	1
7	0.372	1

Answer: 7 trials

	A	B	C	D
1		p =	0.4	
2				
3	1	0.94830888	0	
4	2	0.27166852	1	
5	3	0.49000916	0	
6	4	0.03448615	1	
7	5	0.03467214	1	
8	6	0.63954252	0	
9	7	0.2122916	1	
10	8	0.68014207	0	
11	9	0.58458677	0	
12	10	0.722571	0	

SOLUTION 3:

This is a mixture distribution. Let F_1 represent the lognormal distribution with $\omega_1 = 0.3$. Let F_2 represent the uniform distribution with $\omega_2 = 0.7$.

```
Generate u ~ U(0,1)
Generate v ~ U(0,1)
    If u<= 0.3  then
        x= e^(NORM.INV(v, μ, σ))
    Else
        x = a + (b-a)v
    End if
Return x
```

If $X \sim \mathcal{N}(\mu, \sigma^2)$ is a normal distribution, then $\exp(X) \sim \text{Lognormal}(\mu, \sigma^2)$

By Excel:

Generate Y ~ N(μ, σ^2) via NORM.INV(v, μ, σ), then X = EXP(Y) will be lognormal, where v will be the U(0,1) and by let

$$a = E[X] = 20$$
$$b = V[X] = 2^2 = 4$$

Then,

$$\mu = ln\left(\frac{a}{\sqrt{1+\frac{b}{a^2}}}\right) = ln\left(\frac{20}{\sqrt{1+\frac{4}{20^2}}}\right) = 2.99076$$

$$\sigma^2 = ln\left(1+\frac{b}{a^2}\right) = ln\left(1+\frac{4}{20^2}\right) = 0.00995$$

Using U_1 = 0.943 to pick the distribution implies, X ~ U(10,20) because 0.943 > 0.3

X = a + (b-a)U_2 = 10 + 10*0.398 = 13.98

Using U_3 = 0.372 to pick the distribution implies, X ~ U(10,20) because 0.372 > 0.3

X = a + (b-a)U_4 = 10 + 10*0.943 = 19.43

We "got lucky" and did not have to generate from the lognormal distribution.

SOLUTION 4:

This is a mixture distribution. Let F_1 represent the U(a=20,b=25) distribution with $\omega_1 = 0.25$. Let F_2 represent the Weibull distribution($\alpha = 2, \beta = 4.5$) with $\omega_2 = 0.75$.

```
Generate u ~ U(0,1)
Generate v ~ U(0,1)
    If u<= 0.25 then
      x = a + (b-a) v
    Else
      x= β[−ln(1 − v)]^(1/α)
    End if
Return x
```

0.943	0.398	0.372	0.943	0.204	0.794
0.498	0.528	0.272	0.899	0.294	0.156
0.102	0.057	0.409	0.398	0.400	0.997

Using U_1 = 0.943 to pick the distribution implies, X ~ Weibull because 0.943 > 0.25

Using U_2 = 0.398

X = 4.5[-ln(1-0.398)]^(1/2) = 3.2057

Using U_3 = 0.372 to pick the distribution implies, X ~ Weibull because 0.372 > 0.25

Using U_4 = 0.943

X = 4.5[-ln(1-0.943)]^(1/2) = 7.616

SOLUTION 5:

Chi-squared Variable = $\sum$ *iid* Squared normal variables.

i.e.

If $X_1, X_2, \ldots, X_n$ are independent standard normal random variables, then the sum of their squares has the chi-squared distribution with n degrees of freedom

$$X_1^2 + \cdots + X_n^2 \sim \chi_n^2$$

Use Z = NORM.S.INV(U) where U is read from the table. Do this for 5 PRN's and, square and sum the values. Students could also use the z-table or by Excel.

	U	Z~N(0,1)	Z^2

SOLUTION 6:

(a) acceptance/rejection

(b) majorizing

c) acceptance probability

SOLUTION 7:

a)

Choose g(x) = 3/2. Integrating over [-1, 1] yields c = 3. Thus, w(x) = ½ over [-1,1]

Algorithm

Generate u ~ U(0,1)
x=2u-1
Generate v ~ U(0,1)
If f(x)/g(x) >= v then
x ~ f(x)
Else
$x \nsim f(x)$
End if
Return x

Inverse cdf of w(x)
or
we can see direct that
x = a + (b-a)* u = -1 + (1 - -1)u = 2*u -1

f(x)/g(x) >= v
≅ f(x) >= v g(x)

Accept

f(x)/g(x) < v
≅ f(x) < v g(x)

Reject

where f(x)/g(x)= x^2

b)

u = 0.943→x = 2*0.943 -1 = 0.886
v = 0.398
as f(0.886)/g(0.886)=.785 > v, therefore accept x = 0.886

u = 0.372→x= 2*0.372 -1 = -0.256
v = 0.943
as f(-0.256)/g(-0.256)=.066 < v, therefore reject x = 0.886

Continue in this manner until you get the 2nd acceptance.

21								

SOLUTION 9:

This question demonstrates the splitting property of a Poisson distribution. Each machine experience a Poisson process with mean $\lambda \times p_i$. Thus, the distribution of the inter-arrival times to each drill press will be exponential with mean $1/(\lambda \times p_i)$

Because of the splitting rule for Poisson processes, the drill presses each see arrivals according to the following three Poisson processes:

$$\lambda_1 = \lambda p_1 = 12 * 0.25 = 3$$

$$\lambda_2 = \lambda p_2 = 12 * 0.45 = 5.4$$

$$\lambda_3 = \lambda p_3 = 12 * 0.3 = 3.6$$

Since the time between arrivals will be exponential, we have the following first arrival time to each drill press:

X1 = -(1/3)ln(1-0.943) = 0.9549
X2 = -(1/5.4)ln(1-0.398) = 0.09398
X3 = -(1/3.6)ln(1-0.372) = 0.12923

Generate from 3 different exponential distributions using these rates.

	A	B	C	D
1	lambda =	12		
2	i=	1	2	3
3	p(i) =	0.25	0.45	0.3

13	2	=B12+B8	=C12+C8	=D12+D8
14	3	=B13+B9	=C13+C9	=D13+D9

Alternative solution procedure:

Generate inter-arrival times by using λ=12. At each arrival, determine which drill press sees the arrival by using the PMF (0.25, 0.45, 0.3) to pick the drill press. Continue generating until you get the first arrival at each drill press.
