Q1) The time to failure for a computer printer fan has a Weibull distribution with shape parameter $\alpha=2$ and scale parameter $\beta=3$. Testing has indicated that the distribution is limited to the range from 1.5 to 4.5 . Generate 1 failure time for this this truncated distribution at $\mathrm{U}=0.943$.

## Solution:

Notice that the range is truncated, we have:
$\mathrm{F}(1.5)=1-\exp \left(-(1.5 / 3)^{\wedge} 2\right)=0.22119$
$\mathrm{F}(4.5)=1-\exp \left(-(4.5 / 3)^{\wedge} 2\right)=0.8946$
$\mathrm{W}=0.22119+(0.8946-0.22119) * 0.943=0.8562169$
$X=3[-\ln (1-0.8562169)]^{\wedge}(1 / 2)=4.1779$
Q2) Customers arrive at a service location according to a Poisson distribution with mean 10 per hour. The installation has two servers. Experience shows that $60 \%$ of the arriving customers prefer the first server. By using random numbers $(0,1)$ given
0.943

Q3) Consider the triangular distribution:

$$
F(x)= \begin{cases}0 & x<a \\ \frac{(x-a)^{2}}{(b-a)(c-a)} & a \leq x \leq c \\ 1-\frac{(b-x)^{2}}{(b-a)(b-c)} & c<x \leq b \\ 1 & b<x\end{cases}
$$

a) Derive an inverse transform algorithm for this distribution.
b) Using random numbers $\mathrm{U} 1=0.943$ and $\mathrm{U} 2=0.398$ to generate 2 random numbers from the triangular distribution with $\mathrm{a}=2, \mathrm{c}=5, \mathrm{~b}=10$.

## Solution:

a)

Proof The triangular $(a, c, b)$ distribution has probability density function

$$
f(x)= \begin{cases}\frac{2(x-a)}{(b-a)(c-a)} & a<x<c \\ \frac{2(-x)}{(b-a)(b-c)} & c \leq x<b\end{cases}
$$

and cumulative distribution function

$$
F(x)= \begin{cases}\frac{(x-a)^{2}}{(b-a)((-a)} & a<x<c \\ 1-\frac{(x-b)^{2}}{(b-a)(b-c)} & c \leq x<b .\end{cases}
$$

Equating the cumulative distribution function to $u$, where $0<u<1$ yields an inverse cumulative distribution function

$$
F^{-1}(u)= \begin{cases}a+\sqrt{(b-a)(c-a) u} & 0<u<\frac{c-a}{b-a} \\ b-\sqrt{(b-a)(b-c)(1-u)} & \frac{c-a}{b-a} \leq u<1 .\end{cases}
$$

b)
$(c-a) /(b-a)=0.375$
For U1 $=0.943$, since $0.943>0.375$, we have $X=b-S Q R T\left((b-a)(b-c)^{*}(1-U 1)\right)=$ 8.8304

For U2 $=0.398$, since $0.398>0.375$, we have $X=b-S Q R T\left((b-a)(b-c)^{*}(1-U 2)\right)=$ 6.1989

Q4) Suppose that the service time for a patient consists of two distributions. There is a $25 \%$ chance that the service time is uniformly distributed with minimum of 20 minutes and a maximum of 25 minutes, and a $75 \%$ chance that the time is distributed according to a Weibull distribution with shape of 2 and a scale of 4.5. Using random numbers $\mathrm{U} 1=0.943, \mathrm{U} 2=0.398, \mathrm{U} 3=0.372$ and $\mathrm{U} 4=0.943$ to generate the service time for two patients.

## Solution:

This is a mixture distribution. Let $F_{1}$ represent the $\mathrm{U}(20,25)$ distribution with $\omega_{1}=0.25$.
Let $F_{2}$ represent the Weibull distribution with $\omega_{2}=0.75$.
Using U1 $=0.943$ to pick the distribution implies, $\mathrm{X} \sim$ Weibull because $0.943>0.25$

$$
X=\beta[-\ln (1-u)]^{\frac{1}{\alpha}}
$$

Using U2 $=0.398$
$\mathrm{X}=4.5[-\ln (1-0.398)]^{\wedge}(1 / 2)=3.2057$

Using U3 $=0.372$ to pick the distribution implies, $\mathrm{X} \sim$ Weibull because $0.372>0.25$
Using U4 $=0.943$
$X=4.5[-\ln (1-0.943)]^{\wedge}(1 / 2)=7.616$

| 14 |  |  |  |

Q5) Consider the following probability density function:

$$
f(x)= \begin{cases}\frac{3 x^{2}}{2} & -1 \leq x \leq 1 \\ 0 & \text { otherwise }\end{cases}
$$

a) Derive an acceptance-rejection algorithm for this distribution.
b) Using the first row of random numbers in the top generate 2 random numbers using your algorithm.

## Solution:

Choose $\mathrm{g}(\mathrm{x})=3 / 2$. Integrating over $[-1,1]$ yields $\mathrm{c}=3$. Thus, $\mathrm{w}(\mathrm{x})=1 / 2$ over $[-1,1]$

```
Algorithm
Repeat
    Generate W ~ w(x) which is U(-1,1)
    Generate U ~ U(0,1)
Until U*g(W)<= f(W)
Return W
```

$\mathrm{W}=\mathrm{a}+(\mathrm{b}-\mathrm{a})^{*} \mathrm{U}=-1+(1--1) \mathrm{U}=2 * \mathrm{U}-1$
$\mathrm{U} 1=0.943$
$\mathrm{W}=2 * 0.943-1=0.886$
$\mathrm{U} 2=0.398$
Is $0.398 * 1.5<=1.5(0.886)^{\wedge} 2$ ?
$0.597<1.177$, therefore accept $\mathrm{X}=\mathrm{W}=0.886$
$\mathrm{U} 1=0.372$
$\mathrm{W}=2 * 0.372-1=-0.256$
$\mathrm{U} 2=0.943$
Is $0.943^{*} 1.5<=1.5(-0.256)^{\wedge} 2$ ?
$1.4145<0.098304$, therefore reject W

Continue in this manner until you get the $2^{\text {nd }}$ acceptance.
